INTRODUCTION

CHAPTER 1

Theoretical operational principles of recreation and tourism in the context of stable development of UKRAINE

1.1. Theoretical basis of operation of recreation and tourism in the context of stable development

1.2 Recreation and tourism problems of management of nature in terms of stable development of Ukraine

1.3. The formation and development of tourism and recreational enterprises in the market of tourist services

1.4. Social and economic impact of recreation and tourism for economic development

1.5. Conceptual and theoretical models of economic regulation of regional tourist and recreational complex

Section 2.

Methodological bases of economic regulation of development of recreation and tourism of Ukraine

2.1. Scientific - methodical discourse on the influence of tourism on human person 's development

2.2. Social parameters of population coverage by recreational and tourist services in Ukraine

- 2.3. Methodology for calculating the ecological and economic tourist load
- 2.4. Formation of the informational and methodological basis for assessing the socio-economic impact of the national recreation and tourism sector

SECTION 3 STRATEGIC PERSPECTIVES FOR DEVELOPMENT OF RECREATION AND TOURISM

- 3.1. Status and trends of recreation and tourism in Ukraine
- 3.2. Prerequisites and factors of development of recreation and tourism sphere of Ukraine
- 3.3. Investigation of the stability and reliability of the functioning of the current state of the tourist-recreational complex and economic problems of its development
- 3.4. Improving the socio-economic impact of tourism and recreation areas

SECTION 4 IMPROVING STRATEGY FOR SUSTAINABLE DEVELOPMENT OF RECREATION AND TOURISM IN UKRAINE

4.1. The essence and importance of the sustainable development of recreation and tourism

4.2. The current strategy of sustainable development of recreation and tourism "Ukraine 2020"

4.3. Organizational-economic mechanism of recreation and tourism in the context of sustainable development

CONCLUSION

TTRK - territorial tourist and recreational complex;
C - set goals of tourist activities;
JATP - quality tourism product;

INTRODUCTION

Ukraine occupies a leading position in Europe in terms of availability of valuable natural, historical and cultural resources, able to generate significant interest from domestic and foreign tourists. The complex and mobile nature of modern tourism has created a demand for a safe and comfortable environment for life and health that can provide all the necessary conditions for citizens to exercise their right to rest and freedom of movement. Tourism and recreation are an indispensable attribute of every person's life and an integral part of the economy, which can become a powerful catalyst for the functioning of related industries. The Concept of the State Target Program for the Development of Tourism and Resorts for the period up to 2022 emphasizes the need to create systemic conditions for the development of the tourism and recreation industry for

its proper development and balance of inter-branch links. The development of tourism resorts and activities of Ukraine as a whole is characterized by positive dynamics, the growth of quantitative and qualitative parameters of inbound and domestic tourist flow.

However, against the background of increased competition in the international tourism market, global trends to strengthen the role of states in the stable development of tourism, national domestic tourism product becomes less attractive and competitive. As a result, the sphere of tourism and activities of resorts in the state is not able to ensure the full implementation of economic, social and humanitarian functions, does not contribute to the preservation of the environment and cultural heritage, filling budgets of all levels, creating jobs, increasing the proportion of services in GDP structure. Overcoming the existing negative trends, creating systemic and complex prerequisites for the stable development of tourism should become one of the priority directions of ensuring stable development of the country as a whole and an essential component in addressing issues of improving the quality of life of the population. Problems of development and management of tourism and recreation sphere at the national level were studied by such scholars as I. Pisarevsky, M. Malskoy, A. Boyko, M. Frolov, R. Miroshnik, O. Volodchenko, N. Maksymyuk, T. Tkachenko; at the regional level - I.

Zazgarska, O. Muzychenko-Kozlovskaya, M. Rutinsky, O. Stetsyuk, K. Sochka. The general specificity of the regional administration is highlighted in the writings of L. Gorbach, O. Amosov, V. Mamonov, A. Bezuglogo, M. Datsishina, A. Tkach, V. Keretsman, V. Vorotina, E. Kovalenko and others.

However, it should be noted that in the scientific literature, the works of domestic and foreign scientists are insufficiently focused on the need for integrated system development of tourism and recreation, which determines the relevance of the chosen direction of research. Overcoming the existing negative trends, creating systemic and complex prerequisites for the sustainable development of tourism should become one of the priority directions of ensuring sustainable development of the country as a whole and an essential component in addressing issues of improving the quality of life of the population.

CHAPTER 1

Theoretical operational principles of recreation and tourism in the context of stable development of UKRAINE

1.1 Theoretical basis of operation of recreation and tourism in the context of stable development

There are different approaches to the interpretation of the nature, relationship and correlation between terms of recreation and tourism. Most scientists consider tourism as a form of recreation, others - as separate spheres.

Recreation concept (from Lat. recreatio) Is usually interpreted from two perspectives.

First, it means the process of recuperation. Therefore, in the narrow sense of recreation is considered as the process of recovery, restoration forces incurred during various human activities.

Second, it covers a wide variety of human activities in their spare time to restore power and meet a wide range of personal and social needs [1, p. 404; 2, p. 16]; set of phenomena and relationships arising from the use of free time for recreational, cognitive, sporting, cultural and entertainment activities people on specific areas, including the area outside the settlement, which is the place of permanent residence [3, p.5] and also change the type of activity (not

working) entertainment, recreation, describing the relevant space.

Thus, the concept of recreation describes not only the process of recuperation rights (with its own point of view) but also measures and the space in which it is (position of the medium) [4, p.102]. Currently, social development characterized by the growing role of recreation in the recreation of man. VV Bezugly believes that recreation is to restore physical, mental and neuropsychiatric powers of man through a range of measures in their free time on specialized areas.

That emphasis on renewable recreation features, which against the backdrop of the current global technological, economic and social transformations takes on new meaning. Today, it affects not only the recovery of the labor force, but also the whole person. Restoration work force includes a set of social relations connected with the main renewable power - man. For every socio-economic system characterized by its only her inherent laws and labor recovery features [5, p. 322].

At the same time a number of contemporary authors consider Recreation (from the Latin. *Recreatio* - recovery) as compensatory restoration man spent in the work force, and the creation of a specific reserve for the conservation and increasing physical and intellectual capacity. In modern economics is no common understanding of the term nature recreation

and unambiguous legal definition of the basic concepts related to recreation and leisure. Therefore, there is no clear understanding of concepts such as recreation, tourism, recreation, leisure, entertainment and others. In particular, the law stipulated term tourism, but not defined category of Recreation.

In Ukraine, only two laws form the field of tourism and recreation - "On Tourism" and "On resorts", in the latter period recreation is not used.

In our view, like the meaning of recreation, but to have a certain specificity is tourism, which translated from French means a walk or ride (fr. Tourism - travel) that as a result of completed return to the place where started the way. The ancient philosophers believed that journey - a path of a man who walks the way of the good, leading it to perfection and knowledge of truth. Current understanding of tourism based on its recognition as an important direction of international cooperation based on respect for national culture and interests of each state [6, p. 175]. In the Manila Declaration on World tourism of 10 October 1980 states that the right to rest, vacation, freedom of travel and tourism is a natural and inalienable for every person. It imposes on the State to provide its citizens access to real tourism. Unfortunately, under current conditions, not all of our population is able to realize these rights not only abroad but also within the territory of their homeland [7]. In modern economics are the main approaches to

defining the essence of tourism: 1) set of phenomena and relationships arising from the travel and stay of people out of their place of residence, if the residence does not turn into long-term residence or temporary occupation for earning [3, p . 11; 4, p. 40]; 2) In your travel time, travel with cognitive purposes or on vacation, one of the outdoor activities; activities of persons traveling to and staying in places outside their usual environment for a period of 24 hours. one year, for any purpose, without the activities that are paid from sources are placed at the site visit (by definition adopted by the World Tourism Organization); 3) The temporary departure of persons with permanent residence in health, cognitive, professional and business or other purposes not take up paid employment at home [8, 9]. Given the legislative term consolidation tourism, we are in his research builds on its definition under the Law of Ukraine "On Tourism", namely astemporary departure of persons with residence in health, cognitive, professional and business or other purposes not take up paid employment in a place where a person departs " [9]. It should emphasize the need to expand the concept of tourism in its traditional boundaries, due to the growing intensity of modern entry - exit processes of species diversification, globalization, and their display significant impact on the economy of the world. It can be concluded that the goals of modern tourism are becoming more diverse. In addition to recreational

activities and participation in business, academic and cultural activities he carried out with sports, recreational, educational, religious, environmental, cultural, educational, historical, literary, educational and other purposes. In addition, often uses the term holidays, which means the process of recovery after a temporary decline due to the growth of fatigue under the influence of operational loads, natural means of regulating efficiency. In turn, during recreation understand the process of recovery after a significant and prolonged decrease as a result of stress [10]. As for tourism and excursions, the main criteria is their duration and venue. On temporary differences are quite unambiguous - this daily cycle. All that takes in recreational activities less than 24 hrs., Is a tour of more than 24 hours. - tourism [11]. Thus, the concept of recreation and tourism are common to refer to the process of restoring vitality person because often they are used as synonyms. However Recreation is a broader concept that focuses precisely on the recovery process and healing of human vitality. This can occur both in specialized institutions and residence of citizens. Recreation covers almost all human activities in her free time, she held out her permanent residence. In turn, tourism also always aimed at restoring vitality and development rights, but this concept is narrower because it is always associated with traveling and accompanied by appropriate consumption of services and use of recreational resources of certain areas.

Therefore, in our view, it makes sense to consider these concepts together as a single recreation and tourism sector, which covers a variety of activities (recreational, cognitive, sporting, cultural, etc.) to restore vitality and development rights. These activities may relate to different areas, but in its intended direction focused on strengthening and development of health and vitality of man. Recreation and tourism are part of the national economy, a complex system combines recreational and tourism facilities, infrastructure companies and other industries that have strong industrial and economic relations, sharing resources to meet the diverse health, cognitive, cultural and other needs people. Therefore, logically allocate and specific economic activity - recreation, which is treated as a human activity at leisure rendered to restore physical strength and is characterized by the diversity of human behavior [12, c. 8; 13, p. 255-262]. To further study the concepts of value recreation and tourism appropriate to consider the basic functions that perform these activities. In the literature there are different approaches to the separation of functions. Quite often feature recreational areas are combined in four main groups: biomedical, socio-cultural, economic and political [3, p.26]. Biomedical (spa treatment and rehabilitation) is to restore physical and spiritual strength, further improvement of man; social and cultural - satisfying cultural and spiritual needs of the population, the

needs of the knowledge in the broadest sense; social and economic - reproduction of labor power, which accelerates the growth of productivity and production efficiency. In the literature there are different approaches to the separation of functions. Quite often feature recreational areas are combined in four main groups: biomedical, socio-cultural, economic and political [3, p.26]. Biomedical (spa treatment and rehabilitation) is to restore physical and spiritual strength, further improvement of man; social and cultural - satisfying cultural and spiritual needs of the population, the needs of the knowledge in the broadest sense; social and economic - reproduction of labor power, which accelerates the growth of productivity and production efficiency. In the literature there are different approaches to the separation of functions. Quite often feature recreational areas are combined in four main groups: biomedical, socio-cultural, economic and political [3, p.26]. Biomedical (spa treatment and rehabilitation) is to restore physical and spiritual strength, further improvement of man; social and cultural - satisfying cultural and spiritual needs of the population, the needs of the knowledge in the broadest sense; social and economic - reproduction of labor power, which accelerates the growth of productivity and production efficiency. Biomedical (spa treatment and rehabilitation) is to restore physical and spiritual strength, further improvement of man; social and cultural - satisfying cultural and spiritual

needs of the population, the needs of the knowledge in the broadest sense; social and economic - reproduction of labor power, which accelerates the growth of productivity and production efficiency. Biomedical (spa treatment and rehabilitation) is to restore physical and spiritual strength, further improvement of man; social and cultural - satisfying cultural and spiritual needs of the population, the needs of the knowledge in the broadest sense; social and economic - reproduction of labor power, which accelerates the growth of productivity and production efficiency. In our view, more appropriate to divide the functions of recreation into three main groups [14]: biomedical (spa treatment and sanitation, removal of production and non-production psychological fatigue man), sociocultural (necessary knowledge in the broadest sense, knowledge of the world and their place in it as a defining feature) and economic (recovery of labor). According to the Law of Ukraine "On Tourism" out the following types of tourism: children, youth, family, elderly, disabled, cultural, educational, therapeutic, sports, religious, environmental (green), rural, underwater, mountain, adventure, hunting, road, amateur, etc. [8]. Despite the fact that most recreational classes are informative in nature, isolated purely cognitive recreational activities that are in the media perception of cultural heritage, that examination of cultural and historical monuments, groups and introduction to new areas, countries of ethnography,

folklore and natural objects and phenomena. WITH Halezhno the purpose of the trip are the following types of tourism [16, p.168; 17]:

1. Therapeutic, based on the needs of people in treatment and prevention. Recommendations to travel for treatment issued by medical specialists and execution of all necessary documents can make travel companies. Medical tourism, in turn, has several varieties that are caused by natural agents that are used to influence the human body. For example, climate based on the beneficial effects of sea and mountain climate, forests on human health; mud therapy involves the use of river, lake or sea mud for the treatment of certain diseases.

2. Selling (recreational), which involves the movement of free time to rest and restore physical and spiritual powers of man. This kind of tourism is the most common and widespread in many countries.

3. Sports, which - Journey to participate in various sports competitions in two forms: active (direct part in competitions) and passive (fan as part).

4. Business associated with the need to perform certain business and professional tasks. Travel for business purposes is regarded as one of the major components of modern tourism exchange. They are extremely important from the economic point of view, it is not dependent on seasonal factors. This includes travel delegations or individuals to participate in international negotiations, meetings, national holidays,

coronation ceremonies taking office Heads of State and Government and more.

5. Cultural and educational - traveling people to learn about the natural, historical and cultural sights, museums, theaters, social order, life and traditions of the peoples of the country which is visited. This cognitive purpose may conform to rest.

6. Religious (pilgrimage) - one of the oldest forms of tourism, which involves movement of people to the "holy places" to visit temples and monasteries of religious holidays or absolution. The origin of the pilgrimage is associated with the formation of the world's major religions. As tourism in general, it is internal (within a country) and international.

7. Ethnic, ie, visiting relatives, place of birth or their parents. Of particular importance this type of tourism is for the countries of the population which lives abroad, namely Poland, Hungary, Yugoslavia, England and China.

Because there is a natural reduction of the current first-generation immigrants from other countries and the growing share of the third and fourth, largely lost direct family ties, they travel for the purpose of dating ethnic homeland. These circumstances alter the behavior of tourists travel, in part by increasing demand for location in the hotel, not relatives, their requirements and programs perebuvannya. Varto note that discussed tourism, which are caused by the purpose of travel is not

always found in its pure form. In practice, the tourist usually happens combination of several types of tourism. For example, holiday (recreational) tourism combined with cognitive, academic - with business and others.

According to the functional-branch structure (the set of industries and activities that perform certain functions within recreational complex to achieve the ultimate goals) can be divided into two subsystems (areas): direct service of holidaymakers and tourists and economic support recreation and tourism [13, p. 263].

Recreation and tourism - a complex entity that combines a variety of industry sub-sectors and activities, each of which performs a separate function. This same functions they can perform and other they business systems area. For example, restaurant management or trade services to tourists and not only tourists but also the entire population of the territory. Consequently, most goods and services can simultaneously meet the needs of both tourists and tourists and vacationers unorganized and population that resides in a particular terytoriyiFormuvannya and operation of recreational and tourism facilities provided links to other sectors, which to some extent involved in servicing tourists and travelers. Of course, all these can not be included in this sector, as lastbefore us as an important part of national economy, combining an extensive system of

recreational and tourism facilities, infrastructure companies and other related industries, which have close economic and industrial ties, sharing resources to meet the diverse health, cognitive, cultural and other needs of the population. The scope of the direct service of tourists and travelers form a recreational and tourist enterprises, institutions and establishments (which is the main link recreational complex), such as: hospitals (with alezhno the technology climatic, mud and balneotherapy), recreational (bathing-beach and walking), sports (sports, travel, climbing, hunting, etc.), cognitive (distinguished by the objects given and means of transport). So, Corporate recreation children's rest and recuperation [18, p.5].

Sanatorium recreation includes activities that occur at the resorts, sanatoria, boarding houses with treatment, spa clinics. Tourism and Recreation cognitive (excursions, weekend routes, cultural and educational tourism, etc.) Is divided into amateur and organized tourism and infrastructure deployed on the basis of submitted hostels, hotels, motels, camping. Criticism of the negative impact of tourism on the environment coincided with the theoretical discussion about the sustainable development of society (sustainable development) and sustainable tourism development (sustainable development tourism) and policy decisions related to these pytannyah. Rishennya World Summit in Johannesburg (2002) May become the basis of a qualitatively new stage of substantial

critical views on tourism development and mechanisms to ensure its sustainability. Thus, in the context of sustainable development of tourism a key question is permanent (continuous) coordination and harmonization of the relationship between man and his environment. Therefore, finding ways to solve it is in the plane of the principles and criteria for sustainable tourism and development mechanism of partnership between all stakeholders of a development based on the concept sustainable tourism as part of a holistic paradigm of sustainable development as a whole in the form in which it is established at this stage, incorporated as mini mind, understanding, unity balanced economic, social (including demographic) and environmental performance. It is safe to say the concept of sustainable development is unopposed - nyny simulation of the world, individual countries, regions and regional entities, some sectors (economic activities) and sectors entities. Resort recreational and tourist economy can not develop in the same field, it constantly interacts with many others, are directly or indirectly involved in the organization of leisure and recreation of the population. If the industry complement each other, and the connections between them are sustainable and as a result contribute to meeting the recreational and tourism needs, formed recreation and tourism. It establishments with their own recreation and tourism facilities include various sectors of the economy of a given region,

Sustainable tourism is based on the doctrine of sustainable development, which aims to replace the relationship between man and nature to expand opportunities for economic growth and the creation of a coordinated global strategy of survival, focusing on conservation and restoration of natural communities on the scale necessary to return to the limits of economic capacity of the biosphere . The structure set up the doctrine of ideas, tenets and provisions of various sciences, which formed the basis of UN documents as the "Agenda for the XXI century", the Conventions on climate change, combating poverty and others. Sustainable development involves the economic, social and environmental problems. Development will be sustainable only if equilibrium is reached between the various factors that contribute to overall quality of life. The sustainability of tourism development is a component of national economies. The scope of economic support recreation and tourism activities represented sub nonproduction and production services. Tourism as a sector of the economy is in a complex interaction with the environment and so today, the task of further development of tourism is to reduce the negative environmental impact (pollution from sewage, waste, emissions of air transport, erosion of beaches due to alignment of the coastal area, the impact on the culture of local residents, loss of historical and architectural heritage, employment of minors, etc.). Governments

must be adopted restrictions and regulations to minimize these negative effects. Tourism should be developed so as to benefit the local population, strengthen the economy of the host country, creating new jobs. Tourism industry has great potential, which allows you to make a constructive contribution to the sustainable development of countries and regions contribute to environmental and social sustainability. In developing the foundations of sustainable development of tourism as part of a holistic paradigm of sustainable development as a whole in the form in which it is established at this stage, laid at least balanced understanding of the unity of economic, social (in including demographic) and environmental performance. It is safe to say that the concept of sustainable development is unopposed -nyini simulation of the world, individual countries, regions and regional entities, some sectors (economic activities) and sectors entities. Thus the combination of the terms "development" and "sustainable" and "sustainability" does not fully comply with the concept of «sustainable development», which provides a reasonable regulation of natural and socio-economic processes. The term "sustainable development" does not reflect the basic principles of the concept of sustainable economic, social and environmental development, active management of human activities both at the local and regional levels, including through restrictions. A more accurate in this case would be the

term "sustainable development", ie one that provides a balanced dynamic equilibrium between the components of integrative geopolitical and socio-economic system. Balance - proportionality; balance, proportion between elements of the system that determines the preservation of its quality characteristics. Recognition of the importance of sustainable tourism development and problem solving among key partners, including governments, international organizations, NGOs and the private sector led development of international tourism in 1995 International document "Agenda for the XXI century travel and tourism industry." In various countries, many communities whose main source of income is tourism, relevant programs have been developed locally. The essence of the concept of sustainable tourism includes two key interrelated provisions. The first is the need to meet the needs, including priority, all segments of the population, particularly the poor and disadvantaged, usually through social forms of tourism. With that in tourism are almost equally economical, social and aesthetic needs of people. Second, is the presence of resource constraints, which makes the environment's ability to meet current and future needs of mankind. The main component constraints in sustainable development is a natural environment. However, tourism is also a significant component constraints such as economic, cultural, social and living - those resulting from the

organization of society as technology, culture and education level of the population. Sustainable Tourism Development Based on the characteristic of the process principles. They formulated the WTO and the World Council of Travel and Tourism and focused on four key components - environmental, economic, cultural sustainability, and sustainability of local communities in all their diversity of manifestations of life. hence the ability of the environment to meet current and future needs of mankind. The main component constraints in sustainable development is a natural environment. However, tourism is also a significant component constraints such as economic, cultural, social and living - those resulting from the organization of society as technology, culture and education level of the population. Sustainable Tourism Development Based on the characteristic of the process principles. They formulated the WTO and the World Council of Travel and Tourism and focused on four key components - environmental, economic, cultural sustainability, and sustainability of local communities in all their diversity of manifestations of life. hence the ability of the environment to meet current and future needs of mankind. The main component constraints in sustainable development is a natural environment. However, tourism is also a significant component constraints such as economic, cultural, social and living - those resulting from the organization of society as technology, culture and

education level of the population. Sustainable Tourism Development Based on the characteristic of the process principles. They formulated the WTO and the World Council of Travel and Tourism and focused on four key components - environmental, economic, cultural sustainability, and sustainability of local communities in all their diversity of manifestations of life. The main component constraints in sustainable development is a natural environment. However, tourism is also a significant component constraints such as economic, cultural, social and living - those resulting from the organization of society as technology, culture and education level of the population. Sustainable Tourism Development Based on the characteristic of the process principles. They formulated the WTO and the World Council of Travel and Tourism and focused on four key components - environmental, economic, cultural sustainability, and sustainability of local communities in all their diversity of manifestations of life. The main component constraints in sustainable development is a natural environment. However, tourism is also a significant component constraints such as economic, cultural, social and living - those resulting from the organization of society as technology, culture and education level of the population. Sustainable Tourism Development Based on the characteristic of the process principles. They formulated the WTO and the World Council of Travel and Tourism and focused on

four key components - environmental, economic, cultural sustainability, and sustainability of local communities in all their diversity of manifestations of life. Sustainable Tourism Development Based on the characteristic of the process principles. They formulated the WTO and the World Council of Travel and Tourism and focused on four key components - environmental, economic, cultural sustainability, and sustainability of local communities in all their diversity of manifestations of life. Sustainable Tourism Development Based on the characteristic of the process principles. They formulated the WTO and the World Council of Travel and Tourism and focused on four key components - environmental, economic, cultural sustainability, and sustainability of local communities in all their diversity of manifestations of life.

Thus the concept of sustainable development, as recognized by the international community strategic direction of the evolution of society in the XXI century ; a cross-cutting in nature and is found in every field of human activity. Tourism as an integrated system that covers all aspects of life and a significant number involved economic activities to meet the needs of tourists is a priority object implementing criteria and principles of sustainable development, which determine the requirements of harmonious coexistence of all subjects of tourism business environment.

Recreation and tourism performing socially important and necessary functions - maximum satisfaction of population health improvement, therapy, relaxation, spiritual and physical development [20, 21]. Therefore recreation and tourism should be regarded as a single sector, whose purpose - to restore health and vitality of human development. Recreation and tourism is an important part of national economy, combining an extensive system of recreational and tourism facilities, infrastructure companies and other related industries, with strong production and economic relations, sharing resources to meet the diverse health, cognitive, cultural and other needs of the population.

1.2. Recreation and tourism problems of management of nature in terms of stable development of Ukraine

The territory of Ukraine is a complex and diverse range of geographic, climatic, hydrological and other factors and resources of animal and plant life, unique combination which causes the formation of unusual properties for recreational and health potential of many regions of our country. A large number of cultural and architectural heritage, museums and other sites associated with known historical events and personalities, defines high level of attractiveness of national tourist routes for

educational, entertainment and leisure adventure. In regions of Ukraine formed also quite powerful infrastructure of hospitality, accommodation and maintenance of domestic and foreign tourists. [23] However, the requirement to improve the efficiency of existing significant potential for the development of national tourism and recreation (TRS) in conditions of significant intensification of competitive rivalry in the global market of services for leisure and travel organization is waiving activation of efforts of the state and companies that market to improve the quality of the tourist product and improve business management fields. Exceptional value need this kind of activation takes first place at the regional level,

The second, equally important fact reveals the fact that competitiveness, which initially concerned enterprises and sectors of the economy gradually shifted to the level of states, and in recent years have become the main goal of regional development[25] inwhere competitive advantages in the future, according to Professor I. Yakovenko, market players rule [26].

Particular attention this problem requires for the development, conservation and transition to sustainable development of enterprises TRS located in the coastal zone of the Black and Azov seas, particularly in Odessa and Kherson They are important railways and highways, air and sea ports that lead to favorable conditions for foreign economic cooperation

between Ukraine and neighboring countries [27].

In the coastal regions are concentrated more than 30% of all tourist and recreational resources of Ukraine. An important factor in regional economic competitiveness is natural and cultural complex of the South of Ukraine. [27].

The main recreational resources of the region are: climatic resources; diverse natural landscape; favorable climate; Black and Azov sea, other water and forest resources, objects of nature reserve fund [28].

Competitiveness spa and tourism sector (SKTS) economy in comparison with European recreational areas, tourism and rehabilitation steadily falling. Disorganization and shadow SKTS lead to poor quality tourism, related services and inefficient use of the recreational potential of the republic, the low level of development of recreational infrastructure. Poor sanitary conditions eco-resorts, irrational and inefficient land use and recreational use of natural medicinal resources in the region threaten to decrease status.

Resorts competitive position compared with the nearest foreign resort areas further aggravates irrational ratio between quality tourist and recreational services provided, prices and business units [29].

The main reason for the negative state of recreational facilities is anthropogenic activities associated with negative effects on the environment

[30]: pollution of coastal zones and natural spa resources and air quality targets industry, transport, locals and vacationers; insufficient development of industrial, service and recreational facilities environmental infrastructure (engineering and transport communications, systems maintenance, resource, etc.); destruction ill-conceived construction environment coast, leading to erosion and the destruction of marine beaches, natural recreational landscapes, buildings spa destination; lack of market organization and economic mechanism that can manage and enhance business activity of enterprises

Destructive effects due to anthropogenic particular economic activity, increased development of abrasion and landslide processes in the southern coastal areas. Productive economic activity, which is based on diverse range of processes and operations of mass production of goods and services is one of the most important sources of anthropogenic impact on the environment. Performance factors associated with steadily increasing industrial and economic activity of human society, crucially affect the transformation of the biosphere, resources and sources as a foundation for the formation of a complex system of urgent requirements and demands of humanity to ensure the safety, quality and duration of life and comfort, and therefore determine the hierarchy actually occurring urgent human needs.

Thus, the prerequisite of functioning and

development of industrial and economic system oriented to meet the steadily growing comprehensive social and individual needs, is attracting productive economic activity complex set of natural wealth [31].

The process of economic growth, which is traditionally based on the consumer respect to a limited resource potential of the environment, in the present context of globalization and the extraordinary increase in production activity can lead to a drop in the welfare of the vast number of people. This is due primarily to the deteriorating conditions for rest and recuperation rights, but with increasing threats to their health, quality of life, access to appropriate natural wealth. A typical example of this kind of manifestation of contradictions, which is the result of the aggravation of the negative changes Biosphere protection of human life, is the sphere of tourism and recreation activities (DAP) designed to meet human needs in the physiological (physical strength restoration, recreation,

It is in the field of turbojet problem of strengthening human impact of productive human activity, becomes extremely complex and controversial content. On the one hand, even during the meet a diverse range of needs of tourists in the provision of public entertainment there is aggravation of contradictions between economic (profit increase business and related revenues, improve the trade balance of the state, stimulating infrastructure

development areas, create new jobs) and medical-biological (rehabilitation, support proper psychophysiological state) and socio-humanitarian (increase cultural and educational level, self-development and the formation of moral and ethical values, education, etc.). Tourism functions. Implementation of economic functions primarily involves large-scale involvement in the creation and commercialization of tourism products increasing amount of unique natural resources to meet the needs of the widest range of potential tourists. The consequences of this kind of involvement almost certainly become environmental degradation, depletion of natural resources and ecosystem imbalance territories, destruction of biosphere entities and other negative phenomena. Implementation of biomedical and social and humanitarian functions, in contrast, requires careful preservation of unique natural features, support unchanged and environmental protection, restoration of environmental resources. [31] destruction of the biosphere entities and other negative phenomena. Implementation of biomedical and social and humanitarian functions, in contrast, requires careful preservation of unique natural features, support unchanged and environmental protection, restoration of environmental resources. [31] destruction of the biosphere entities and other negative phenomena. Implementation of biomedical and social and humanitarian functions, in

contrast, requires careful preservation of unique natural features, support unchanged and environmental protection, restoration of environmental resources. [31]

On the other hand, mainly anthropocentric nature of human productive activity for a long time conditioned the use of extensive approach to the exploitation of the resources of the environment that determined purely consumer oriented process of economic growth, self-centered focus on exhaustion of the existing resource base and so on. Thus, increasing the welfare of society based on productive economic activity revitalization objectively enhances general population using a wide range of natural sites suitable for recreation, but at the same time objectively reduces the quality of rest because of the deterioration of the environment as a whole biosphere [31].

The basis for overcoming these differences and the related negative consequences of their occurrence should be considered the implementation of sustainable development, in accordance with which to overcome the dichotomy environmental and economic aspects of the operating environment should be based on compliance with environmental priorities preserving favorable to the human biosphere formations and proactively (relative to the dynamics of the exhaustion of the existing resource base) and the development of new and renewable sources would zpechnyh ecosystem resources.

This is stated in the recently adopted "Strategy of economic and social development UKkrayiny for 2011-2020 .. The main goal of the strategy is to achieve sustainable growth in the level and quality of life through a balanced system innovation type, dynamic economic development and implementation of strategic interests of Ukraine in the Black Sea region.Implementation SKTS in "development Strategy Ukraine "outlined seven priority areas, four of which have the tasksustainable recreation and tourism Nature [32 sec. 14]: Alleviation of environmental problems and ensure good environmental status of the region; improving regulation of the use of coastal resources; preservation of cultural heritage, biodiversity, flora and fauna, and natural landscapes zhittediyalnosti species; ensure uniformity of spatial use of tourism and recreational potential of Ukraine, leveling demand for coastal resources.[33].

In this direction, working as domestic schools of academic and university science (Institute of Regional Studies, National University of Ukraine. Shevchenko National Academy of Environmental and Resort Construction, Tavria National Vernadsky University, Odessa National University and .And. Mechnikov, etc.), as well as individual scientists of Ukraine and CIS countries (SO Bogolyubov [34], AA Golub [35] A. Gusev [36], and BV Burkyns'kyi Kovalev NG [37]S.M. Kurazhkiivskyy[38], VV

Pobirchenko and IM Voronin [39] MF Reimers [40], and others. Analysis of [34-49] shows that the problem of recreational nature, there are three groups of approaches - environmental, geographical and economical, each of which is entirely legitimate and consider the issue from the perspective of the existing problems. However, publications related to the development of organizational and economic mechanism for sustainable recreation and tourism nature, are virtually absent. [41]

The closest to the problems, the researchers came V.V. Pobirchenko and IM Voronin, considering the priority areas of improving the structure of complex environmental territory [39]. The issues of organization of economic structures in conjunction with the requirements of effective nature and institutions, forms and methods of recreation management in conjunction with the interests of the national economy, unfortunately in the open literature did not find proper reflection. For the first time the concept of "Nature" was proposed by the Soviet ecologist Y. Kurazhkovskym in 1969 [38]

According to the definition of nature - a regulation of all types of natural resources for the economy and health care. RDeveloping the idea of nature viewed and complemented his followers, VA Agutin, IP Gerasimov, BCPreobrazhensky, MF Reimers et al. MF Reimers, for example, defines nature as the totality of all forms of exploitation of

natural resources and means for its conservation (natural prey and processing of mineral and biological resources, their restoration, protection of natural living conditions, systems, etc.) [310].

Currently, there are different definitions and interpretations of the essence of nature. However, the basis of all the definitions of its essence is the interaction of practice and human nature in order to meet the material and cultural needs of society. This interaction will be effective the rational (reasonable), conservation and restoration of natural (including recreational) resources. Nature performs vital functions such as providing public natural resources and enabling people to rehabilitation through recreation and tourism, aesthetic pleasure.

The development of productive forces leads to the inevitable growth in consumption of natural resources and the degree of pollution of all elements of the environment. This simultaneously exhausted natural resources, non-renewable, deteriorating health, decreases productivity, which led to the formation of a new science - environmental economics. The subject of the study of science and technology is a method of effective action on human nature in order to maintain the dynamic equilibrium of substances in the environment, which requires considerable financial costs [42]. The cost of maintaining the necessary balance is used to preserve the favorable economic conditions, restoration of natural resources in the

present and the future.

MF Reimers [42]15 formulated laws of nature. The most important are:"The law reducing natural resources "and" Law exhaustion of natural resources ", which are based on human activities can be strengthened or weakened. Hence the need for such interactions with nature, in which the duration of these laws would have lasted long beyond measure. Enterprises TRS as much as possible should be interested in preserving the natural environment as the basis of their financial well-being. It is the natural environment and the natural wealth of the territory are the primary factors of attractiveness and competitiveness in the market for business tourism and recreation industry. Thus, the effectiveness of management (actions) such enterprises must entirely depend on the quality of their interaction with the natural environment and its potential. However, the effectiveness of management depends on the set of elements of organizational and economic mechanism to ensure effective and sustainable environmental management in the recreation-based management and the formation of long-term market development of tourism and recreational services. This, in turn,

In the present context an important role in the development of culture of nature play local and regional authorities themselves producers tourist and recreational services. The fact that the benefits of failure and maintenance recreational facilities in the

region are primarily locally and forcing local authorities to give priority to them. Therefore, developing targeted programs, development strategies and other documents to create organizational and economic mechanisms of nature management system development and regional tourism and recreational businesses. Important questions while occupying investments and formation of competitive markets recreational services that are exacerbated in a globalized economy. This requires reliable scientific theoretical framework and new tools to address a number of challenges floor ' related to the mobilization and rational use of available natural resources and environmental management in the region of careful environmental and socio-economic applications. We believe that the formation of sectoral and territorial structure of TRC capable of producing competitive tourist and recreational product is impossible without efficient environmental management system construction and formation of the organizational-economic mechanism to ensure SRTP (Fig. 1.1). Recreational resources are considered as one of the basic factors of HDS is the basis for production planning recreational product. It is very important as it seems, is the question of ownership of these resources and minerals, which is part of the national wealth. Therefore, the value of all the recreational resources should be determined as well as the cost of national wealth to the cost of state territory

recreation. Of the value of recreational resources system depends on economic incentives for subsoil use, payment for environmental pollution. Consequently, formation and distribution of income from Nature should be regulated by the state based on the respective inventories, which are the need of recreational facilities on the grounds of accessibility of natural systems entails the problem of preservation of nature, so important is the balance of environmental priorities depending on the degree and type of use recreational resources, and recreation facilities interaction with the natural objects of nature. Unfortunately, only formed. The main stages of construction of this mechanism are: the formation of resources, diagnostics, analysis, evaluation, clarification purposes; Assessment of resource utilization; analysis, forecasting, strategy and prospects resource utilization of natural resources; use planning and environmental resources; ensuring the development of natural resources; assessment of socio-economic development of natural resources. *formation resources* at the expense of natural resources lies in the definition of natural resources, which is characterized not only by their presence and capacity, but also the costs of use, quality and competitiveness at local and international levels, as well as the possibility of replacing natural resources artificially created substitutes [40] if possible. Natural resource potential replacement is

usually considered in the release specific resources from the sale due to business functions. An important factor in the formation of natural resources is the consideration of a number of external factors, such as the following [40]: advanced technical and technological possibilities of extraction and primary processing of natural resources (plunder of mineral water, mud, etc.) that enable lower operating and capital costs; existing legal framework for the use of natural resources; market conditions that determine the economic feasibility of using a particular natural resource and its attractiveness; the relationship of society and local communities in the development of recreational facilities and natural resources; the current system of taxation on prey, primary processing and use of natural resources. The influence of the environment can lead to both growth and to the reduction of natural resources in the region, Feature of assessing the possibilities of natural recreational resources is the fact that it is necessary to consider the use of multi-variant of the same natural resource, such as recreational areas (by type of tourism types sanatorium enterprises, etc.). Each of these options has a different burden on nature, provides a variety of products to its production costs and market prices that have different value to society. Target Development Strategy (see. Figure 1) is a key component of organizational and economic mechanism to ensure SRTP, which allows to determine the recreational

potential factors set goals, choose the criteria, indicators and related functions to achieve their goals. An important part of the organizational and economic mechanism of environmental management is the analysis, forecasting, strategy and prospects for the use of resources of nature and its potential. Changes of indicators that make up the evaluation of potential use of the resources of nature, affecting the stability of the level of demand and market prices. This situation indicates a sensitivity economic evaluation of natural resources (eg recreational area) to various external and internal factors that must be considered when planning the use of resources and possible risk factors. [31]

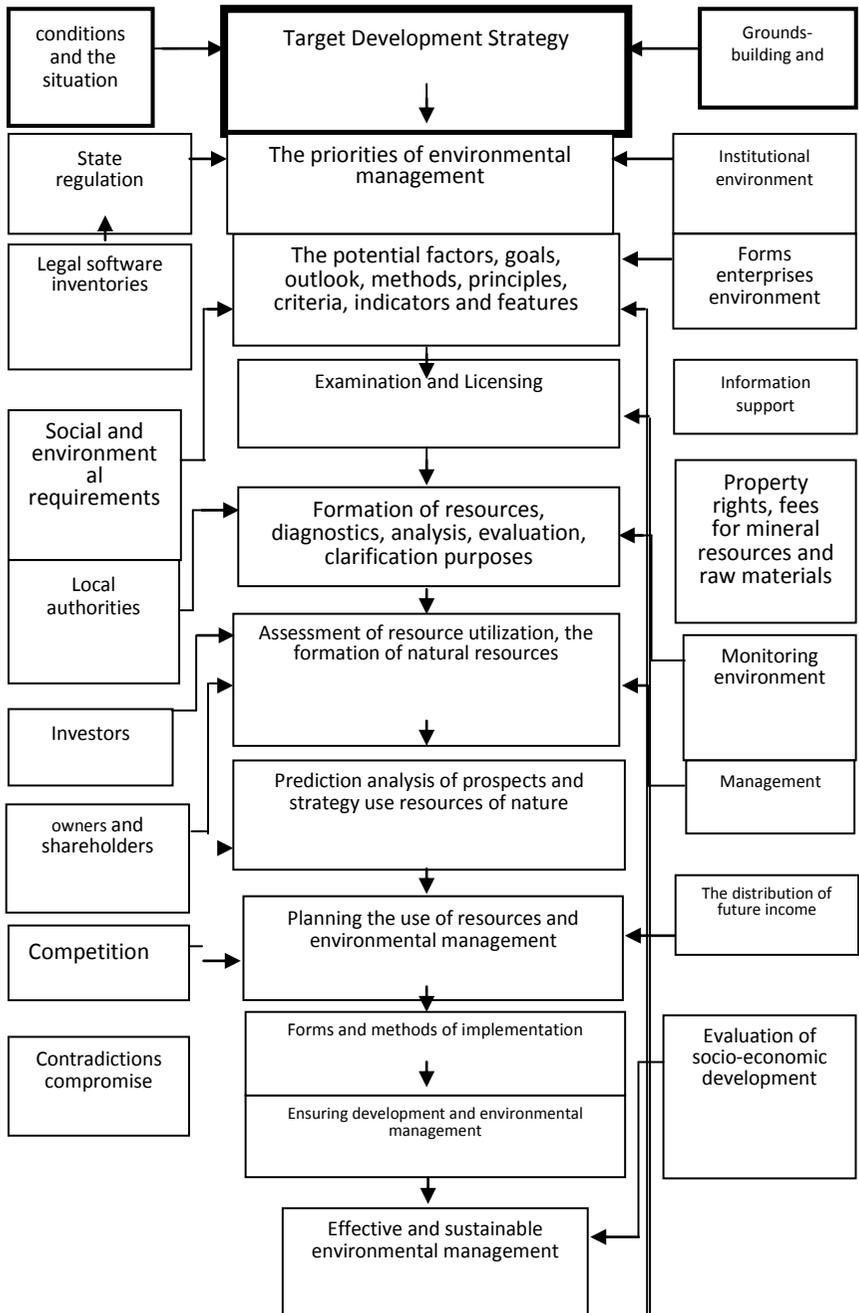

Fig. 1.1. Model management of sustainable recreation and tourism Nature

use Planning Resources and Environmental Sciences is to identify the best possible alternative use of natural resources, taking into account the proposed projects of nature. However there may be some contradictions and conflicts between users of resources due to their obvious limitations or technological (or social) incompatibility of various types of economic activities within the same territorial area (destynatsyy). Emerging conflicts are closely related to the above sensitivity Nature resources to different users (enterprises). This situation is exacerbated by the absence or illiterate opratsovuvannya plans RPS (development of productive forces) and low-quality master plans development of territories. Anyway,

Ensuring development and environmental management aimed at identifying the most appropriate

means and actions to preserve and possible development of nature controlled by regulating factors at the local territorial level, that is, through effective management. These include: reducing current expenditure as a prey or natural resources, impact on the market means possible, internal and external investment assistance in obtaining preferential treatment in terms of lending, etc. These measures should focus on priority areas of greatest growth in natural resources .

Evaluation of socio-economic development of nature should lead to efficiency of nature based external effects, which should be further economic analysis of the factors contributing to increase efficiency and reduce the impact of destabilizing events. In general functioning of the organizational and economic mechanism of nature (as applicable) may be not only directly, but also the iterative nature. The peculiarity of the economic valuation of nature is the fact that the assessment concluded estimates of the components of a particular resource, with specific components. Different components must be used different approaches [44].

In the field of turbojet ensure sustainable development and greening productive economic activity, in our opinion, should be based on the following conceptual provisions and requirements [31].

First, consumption potential formation of

tourism products (TP) and provision of services has necessarily limited the scope of permissible with ekodestruktyvnoho human impact on the environment, which requires deliberate and targeted proactive submission (greening) of all aspects of the functioning of tourist and recreational complex given territory (and in some cases, the existence of unique ecosystems - and also other business activity carrying out activities within the region) requirements to preserve natural recreational resources.

Second, sustainable development DAP should be based on the criterion of maximizing compliance with the requirements of environmental effect within the entire area containing natural resources, access to which is a source of recreation and leisure. In turn, integrated approach to the environmental impact assessment of tourist and recreational services should be based on thorough economic, technological, organizational, social and cultural aspects of regional economic complex, and in the context of harmonious integration, balance and combination of conservation efforts in the field of turbojet of environmental and economic activities of other entities at the regional, national and international levels.

Thirdly, to ensure sustainability of DAP within a given territory must be based on the implementation of a dynamic approach to the development and implementation of innovative measures to prevent the accumulation and aggravation ekodestruktyvnyh

trends in the formation and consumption of TS through activation of environmental protection, steady reduction in specific consumption of natural resources, etc. . The implementation of such activities, as well as the organization of DAP within a particular area as a whole, will involve the need for full implementation of environmental requirements for operation of the respective business entities that integrate elements of environmental management, control and audit performed in a circle in the formation and implementation TP functions, processes and procedures.

Fourth, the implementation of environmental priorities for sustainable development DAP would expand the use of methods of social and socio-cultural impact on the development of consumer needs and individual preferences of potential users of TA to enhance the differentiation of social requirements for environmentally friendly technologies and modes of provision of services through the formation of proper motivation mechanism of stimulation environmental focus of consumer expectations.

Fifthly, the formation of the motivational component of greening the organization and management of subjects providing tourist and recreational services should be based on decentralization of responsibilities and division of responsibility for the performance of administrative functions in the field of environmental protection and

resource conservation through the widespread adoption procedures individual self workers in preparation and decision making capabilities to identify and implement measures aimed at rational and dBA ylyve natural resources.

Implementation of these conceptual provisions and compliance with environmental priorities to ensure sustainable development DAP can not be achieved within the functioning of individual entities, and therefore objectively requires activation processes of integration within a whole area of the tourism industry. Developing appropriate complex organizational and economic mechanism of functioning and sustainable development of the complex should be based on the implementation of the cluster approach, in which participants TRC joint efforts will be made not only on operations around the provision of quality tourism products, but also to preserve the unique natural resources needed recreational environment for the restoration of the rest.

Uneven natural resources, industrial and social potential areas ARC and their economic expertise and infrastructure that has developed, caused the imbalances of development both within the TRS and the peninsula as a whole. The load on the coastal areas of the Crimea distributed unevenly and the complexity and diversity of the tasks of rational use of recreational resources requires the identification of priorities and SRTP.

Development TRS based on the implementation of the priority areas for sustainable environmental management and transformation SKTS should lead to improving the quality of recreation and tourism products and increase their competitiveness as a whole, because the nature and climate, their attractiveness is a major incentive in choosing a client and an important content of their products. At the same time achieve SRTP is impossible without proper additivity and a combination of economic, social and environmental interests at the national and regional levels. Requires a complex of legal, organizational, economic, administrative, scientific, financial and other innovative activities and relationships aimed at efficient use of rich recreational and tourism potential of Crimea and its destinatsiy [45] (Fig. 1.2).

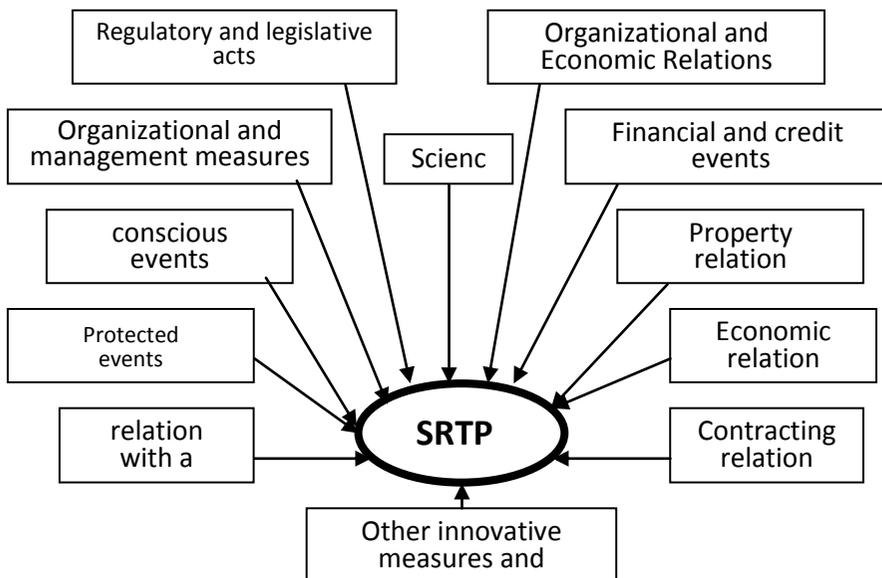

Fig. 1.2. Bigger structural model of sustainable recreation and tourism Nature (SRTP)

Implementation of these models (Fig. 1.2) should be carried out in the interests: the state, recreational and tourist regions (destinations), their inhabitants and rekreatov and have adequate information provision. This model can be viewed as a set of rules structured system of legal, organizational and economic nature, allowing system elements - its participating organizations efficiently communicate both within companies and associations (clusters), and with the environment. These components can create models defined basis to ensure balanced socio-economic development of destinations and increase the investment attractiveness of resort regions.

Generalization of various publications [40 - 45] and existing practices of environmental management allows you to deepen and specify previously set out to "Strategy of development of southern regions" Interpretation priorities SRTP. They should be based on a set of defined basic principles and activities, including:

- careful regard to the existing biodiversity of the region, natural features, quality of water and air, land and landscapes;

- creating conditions for ekodestruktyvnoho human impact on the environment;

- compliance with requirements of criterion of maximizing environmental benefits within the entire territory of Crimea;

- careful attention to ethnic and socio-cultural identity of the local population;

- development of tourism and its infrastructure, ensuring the needs of the local population and its socio-economic interests;

- free access to the sea coast and beaches citizens of all categories;

- the need to find a balance between business objectives and the local population, tourism development and environmental protection;

- tourism development considering the quality of the tourism product and the specifics of each resort destinations;

- submitting coastal area Crimean resorts and

determining the status of their specialization and tourist centers destinatsiy;

- determining the status of the resort areas of the state and local levels in the coastal zone;

- limiting tourism development to a level of environmental and social capacity and environmental loading areas;

- use of resources derived from tourism for the implementation of measures to restore the environment and destinatsiy respective territories;

- inventory, environmental review and certification of land and facilities of health, recreational use as well as identify additional land with natural healing properties;

- balanced development of tourism and other existing economic activities, including fishing, wine, local crafts;

- providing Civil Engineering protect the coast from the negative influence of shear and abrasion processes, suspension erosion of land;

- shaping the motivational component of greening the organization and management of business entities;

- greening urban policy and the provision of urban planning in coastal and other resort areas;

- controlled urbanization that provides protection destinatsiy with ecological, cultural, archaeological, historical or scientific value;

- combined efforts of central government, local

communities and business structures in territory development and clearly defined responsibilities for the preservation of natural and cultural landscape.

Thus, the author stresses that the implementation of measures for the development of enterprises recreation and tourism should be carried out simultaneously with the transformations related to the strategic development of clusters of tourism and recreational businesses.

The main directions of transformation of enterprises should TRD be supplemented by the following organizational and economic measures and actions [194]: need to develop modern infrastructure TRD economic actors at European standards; social orientation reforming of DAP for tourists (tourist) and the local population; implementation mechanism adopted and proposed reform priorities DAP enterprises; DAP modern information software; Integration thrust turbojet entities and agents, providing a single interconnected system (TRC) sustainable operation in a globalizing world economic system. In this way, you can put that identify priorities for support. SRTP provides an opportunity to improve existing approaches to sustainable environmental management from an economic point of view. The proposed methods allow to better understand the processes and conditions of natural resource management in terms of tightening market competition and consider the development of nature as

the most important bases of formation of effective management of recreation that allows turning to the territorial organization and market dilnosti tourist and recreation businesses.

1.3. Formation and development of tourist and recreational enterprises in the market of tourist services

The development of the tourist services market (RTP) has not only economic but also social value, providing a basis for meeting the recreational needs of the country's population and citizens of other countries. The social effect of tourism, expressed in solving the problems of improving the population, increasing its employment and development of the person. The growing role of tourism in the world's economies initiates the study of the peculiarities of the functioning of this sphere of human activity and, above all, its content. However, often systematization of factors affecting the RTP, is presented in the socio-demographic, psychological and behavioral

characteristics of consumers [4,9,21], in which the main component is the level of material well-being of the consumer. The main factors here are: the availability of free time, the structure of the population, age, income level of citizens, education, occupation, belonging to a certain race, gender, etc. During the history of the formation of the tourism industry depended on the availability of free time and the possibility of movement of citizens in ancient Greece and ancient Rome for free time it was possible to determine the class of citizens who were free and financially secured. Persons who had free time belonged to the upper classes of society, therefore, could travel to attend sports competitions, theatrical performances, celebrations. The era of tourism in new technologies and informatics is shown in Fig. 1.1

In the era of the ancient world (from 3000 AD to 330 AD), tourism develops in connection with two events - the opening of the Olympic Games (from 776 AD AD) and the world truce. At this time, the popularity of the travel of athletes and spectators (relatives, friends, etc.) to participate in the competition. There are also tourist destinations: thermal tourism (or geothermal tourism), religious tourism (Delphi, Dodon, Elefsini), philosophical or educational tourism

(Athens, Egypt, Samos, Milos), cultural tourism (theatrical performances, drama in Athens, Epidauros, Ephesus), conference tourism (Corinth, Niemea, Delos). Significant contributions to the development of tourism have made travel writers and geographers (Nearchos, Captain Alexander the Great, Arrian, Pausanias, Eratosthenes, Herodotus, Strabo and Plutarch). the development of agriculture and crafts, the accumulation of scientific notions about the earth, the extinction of mathematical geography, the foundations of navigation and the methodology for determining geographical coordinates (Eratosthenes from Cyrene in 276-194 BC, the Hipparchus 190-125 years BC) The possibility of round-the-clock travel was foreseen

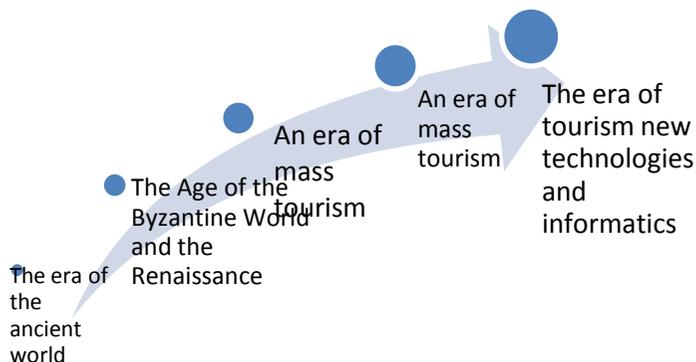

Fig.1.1. Stages of evolution of tourism

Source: Developed by authors

Commercial maritime shipping in Ancient Greece and Phoenician has facilitated the inclusion in the international system of economic relations of large areas of Europe, the Black Sea and the Caucasus, West Asia, North and West Africa. Some routes of ancient Greek seafarers have not lost their relevance today ("from the Vikings to the Greeks," "the way of the Argonauts," etc.). Along with the Greeks, the founders of tourism can be considered and Sumerians, because they own the invention of money, cuneiform

and wheels. In this era ports were created, sea transport was improved, ground transport was improved due to the creation of large roads, which opened up wide opportunities for the implementation of local and world travel. The era of the Byzantine World and the Renaissance (from 330 AD to 1840) is characterized by the development of religious tourism, namely the journey of pilgrims from all over Europe to Jerusalem and the Holy Land. The peoples of Europe realized that the horizons of travel expanded after the great discoveries of new lands - America, Australia and China. Also, long-term trips of aristocratic families (for three or more years), the purpose of which were expansion of the spiritual space, admission to the royal courts, the so-called "grand tours." The era of the industrial revolution with the discovery of a steam engine and the development of rail networks added tourism features of the mass organization. In 1843, in Europe, an agreement was reached on pre-defined rates for the services of a first-class hotel, and the first travel agency was created by Thomas Cook in England in 1841, whose employees organized heavy and long trips to Europe, America and the Holy Land, as well as in 1874 The city has established a tourist voucher [3]. Significantly influenced and gave a new impetus to the

development of world tourism appearance of a telegraph in 1837, a phone in 1876, a radio in 1896, the mass production of cars from H. Ford in 1905-1910 and the construction of highways. In Greece, in 1843, the first modern hotel "NEON" (Athens) was opened, built by the Italian Casale. From 1910 to 1920, several branded hotels around the world began to work, including "Ilion Palace" and "Grand Hotel" in Athens.

In all states, official travel agencies are created. In 1914 in Greece, such an institution was the "Independent Office of Foreigners and Exhibitions". The first definition of tourism was formulated in 1942 by professors Hunziger and K. Krapf in the following way: "Tourism is a set of relations and phenomena arising from travel to the destination and residence of non-permanent residents, if the stay is not characterized by permanent residence and during which does not carry out any activities for income "[7]. The fourth era (from 1945 to 2000) is characterized by the massification of international tourism in the postwar period and is distinguished by the use of the aircraft for organizing mass tourist trips of Americans to the famous Western Europe. At the same time, hotel networks and tourist infrastructure

are developing, as well as large travel agencies around the world, which quickly formulated the world tourism industry in the postwar period, are becoming widespread. Among the factors that influenced the development of mass tourism after 1950 we can distinguish the following: peace consolidation, political and economic stability in developed countries, "democratization" of the right to tourism (increase in free time, in connection with the establishment of paid leave and available vacation time duration of 4-5 weeks); demographic and economic factors in the development of tourism, reducing the time to overcome due to the development of public transport and the production of jet aircraft, the organization of world tour operators and travel agencies, sea cruises and tourist buses; the transformation of tourism into a consumer product: the differentiation of prices and the specialization of services (the cost of a tourist ticket, due to the lower cost of the airline makes tourism even more attractive). dependence of tourism on consumer models developed in the postwar period. promoting tourism activities of travel companies, sectoral organizations. promoting direct exchange of currency without documents, internationalization of national currencies and travel simplicity, the development of

travel insurance services and the use of credit cards facilitates travel and contributes to an increase in the number of trips [4]. In June 1991, at the International Statistical Conference in Ottawa (Canada), with more than 250 participants from 90 countries, the International Tourism Organization outlined the following definition of tourism: "Tourism" is narrower beyond the scope of its coverage of concepts than "travel", since it relates to specific types of trips carried out by a traveler outside his normal environment during a period not exceeding one year for non-employment purposes in an enterprise permanently located in a visited location. " Persons who make such trips are called by visitors [18]. Modern tourism focuses on the human needs of finding new knowledge, comparing the cultures of different countries of the world, satisfying and fulfilling physical and mental experiments, receiving pleasant emotions and joys. The European Council in the regulation on the future of European tourism notes: "Tourism is one of the main sectors of the European economy, since it positively affects the growth of the GDP of the member states and the level of employment and contributes to the achievement of a true internal market for services. Tourism contributes to a high level of employment and social

security, sustainable development, quality of life and European integration, social and economic cohesion, and contributes significantly to the achievement of the objectives of convergence "[6]. The Law of Ukraine "On Tourism" of 1995 states that tourism is a temporary departure of a person from the place of residence for health, cognitive, professional, business or other purposes without having to carry out paid activities in the place where he or she leaves.

According to this document, a tourist product is a pre-designed tourist services complex that combines at least two of these services that are being sold or offered for sale at a specified price, which includes transportation services, accommodation services and other travel services not related with transportation and accommodation (services for organizing visits to cultural objects, recreation and entertainment, sale of souvenirs, etc.) "[14]. The era of new technologies and informatics (from 2000 - to date) is characterized by the use of the latest technologies in tourism, which facilitate the transition from organizing mass tour operators to the individual-type nature of the choice of rest and travel to another country through an independent system of online hotel reservations , airline tickets, car hire, bus tickets, cruise and ferry tickets. For example, the Booking company attracts

more than 20 million users monthly and carries out 550 thousand nightly bookings per day, as its website contains about 320 thousand hotels from 184 countries in 43 language versions. Global hotel services are also provided by Trivago, Tripadvisor, Airfastticket, etc. [5]. Sustainable development of tourism enterprises in the context of the development of tourism industry described M. Khumke. In his work we find an analysis of approaches to business planning, a description of the peculiarities of the construction of the tourism business, the methods of market analysis of tourist services and competitors available on the market, methodological approaches to the formation of a marketing strategy and operational planning, on the basis of which it is suggested to implement methods of planning sustainable development 46 .

Small and medium-sized enterprises play an important role for the further sustainable development of the tourism industry. There are a number of explanations for this. So, P. Keller, considering the prospects for the development of tourism business on the basis of the analysis of the activities of small and medium enterprises, notes their high ability to flexibly respond to the challenges that arise in a competitive environment. In his work, the fundamental problems

of the structure of the "tourist industry" are explored, in particular, the client-oriented approach to the perception of the tourism industry is generally defended (according to P. Keller, tourism as a sector of the economy can be described solely in terms of demand, and the tourism industry exists only at a time when there are buyers in search of tourism services), analyze the advantages and weaknesses of the industrial (such as that provided by large enterprises) and retail tourism, the phenomenon of "imperfect competition" as the dominant structures of the tourist market, new promising marketing strategies for small and medium-sized tourism enterprises are proposed, with a special meaning [44].

KANA Panasyuk has investigated the peculiarities of the sustainable development of small tourist enterprises. In her work the components of sustainable development are analyzed and management tools for them are opened, the integral forecast of the life cycle of small tourist enterprises is constructed taking into account the internal potential and external information field, and, therefore, an improvement is proposed to the mechanism of management of small enterprises with the provision of their sustainable development [48].

Methodical and applied problems in the management of the development of tourism business enterprises were investigated by Dimidenko I.V. Scientist systematized the factors of development of tourist enterprises, proposed a conceptual model of management of this process, improved model of profitability of the implementation of tourist services and developed a model of mass service, which helps to determine the optimal number of personnel, regulating the flow of tourists and reducing waiting times for service provision [49].

The market for tourist services performs a number of functions, such as determining the value of a tourist product, organizing consumer access to a product, coordinating the processes of production and consumption of tourist services, maintaining the balance of demand and supply, stimulating efficiency and minimizing the cost of tourism services, differentiating market actors in depending on their effectiveness, stimulating the production of services for which there is demand [50, p. 2-3]. Tourism is not only a global economic phenomenon, a highly developed sphere of the world economy, but also a popular form of recreation, which has a significant impact on social, economic and cultural development

in the global dimension. The tourist industry is one of the largest sectors and major sources of income in countries such as France, Spain, Italy, Greece, Turkey, Egypt and many others. Market functions can be grouped according to the following categories: regulatory, stimulating, optimizing, informational, and sanitizing.

Regulatory functions market tourist services performs in the context of balancing demand and supply, production and consumption of travel services. Incentives include increasing efficiency in a competitive environment, finding ways to better provide "abstract, high-quality travel services" in the context of customer-oriented management.

Optimization is revealed through the simulation of optimal use of the factors of the production of tourist services. The market of tourist services (RTP) performs a number of functions, such as determining the value of a tourist product, organizing consumer access to the product, coordinating the processes of production and consumption of tourist services, maintaining the balance of supply and demand, stimulating efficiency and minimizing the cost of tourism services production, differentiating sub-objects of the market depending on their efficiency,

stimulation of production of services for which there is demand [35, p. 2-3].

Today the infrastructure of tourism is rapidly developing, as well as improving the hotel business (the construction of "resort hotels"). The tourist zones are constantly expanding, which means the beginning of a new era of development of local and world tourism.

International or local tourist services include the following intangible types of business: hotel services, local and foreign transportation of passengers, communications and communications, advertising, excursions and cultural events, entertainment and attractions, catering, sale of souvenirs, shopping tours. Tourism is not only the world economic phenomenon, an actively developed sphere of the world economy, but also a popular type of rest, which significantly influences social, economic and cultural development in the global dimension.

The essence of the market for tourist services is revealed through the concept of competition and competitiveness of its subjects. At the present time, when the supply in the market exceeds demand, it is advisable to talk about these concepts as those relating

Fig. 1.5. Systematics factors in the formation and development of tourist recreational enterprises in the market of tourist services

Primarily to manufacturers and intermediaries in the production of tourist services. The systematization of factors for the formation and development of tourist

and recreational enterprises in the market of tourist services is shown in Fig. 1

Competitive conditions of activity form a specific environment in which the interaction between the producer and the consumer of travel services is mediated not only through the activities of intermediary firms, but also in connection with the information content of the market - through content information about prices, quality of services, etc., which is estimated by the consumer and On the basis of this assessment, decisions are taken on the further use of services and the recommendation of their specific supplier to friends, friends, a wider audience, for example, through social networks. The market generates the relevance of the formation of a participant's behavior strategy. One of the ways of interaction between market participants - producers and intermediaries in the provision of tourist services is to participate in clusters. The basis of the creation of a tourist cluster is the concept, more than a tourist service - a tourist product. Clustering in the field of tourism takes place on the basis of the exchange of ideas and information, trust, coordination of actions. Tourist clusters cover a group of businesses located in

a common region. These enterprises have a common tourist infrastructure, interact in the local market, etc. [74, p. 159]. The conducted research of the theoretical principles of management of enterprises of the tourism industry gives grounds to assert that at the present stage of development due to a significant number of enterprises in the market, other factors, an important factor in successful activity, and less often - the survival of an enterprise is its competitiveness. Market conditions characterize the economic situation, formed at a certain point in time due to the combined effect of various factors and conditions, establishing the ratio and power of the impact of demand and supply, as well as the level and dynamics of prices for tourist services.

Thus, the factors motivating integration with their prerequisites, as can be seen from the material presented, are objective. At the same time, integration itself is inherently subjective, since the tools of "cultivating" competitive associations need defined goals, methods and ways of their implementation, which are developed and implemented by people who build fundamentally new patterns of behavior and interaction. In 1968, the World Tourism Organization (UNWTO) included tourist flows in the system of

publishing national accounts under the recommendations of national accounts [11]. For the purpose of international comparison and unification, the World Tourism Organization (UNWTO) has developed international recommendations for Tourism Statistics in 1978 and 1993. The latest version of the International Recommendations for Tourist Statistics is 2015 (International Recommendations for Tourism Statistics 2015) and the Tourism Satellite Account (Recommended Methodological Framework 2015)

Given the accumulation of the results of tourism research and the existing experience of its development, tourism can be defined as an autonomous phenomenon with components of consumption and free time. Its development has spread to the whole world and is now considered a traditional and integral part of everyday life of people [17, p. 36]. According to the above definition, tourism is an integral part of the category "travel", and "visitors" are categories of "traveling" both in the national and international context. The same definition is used and specified within the framework of the balance of payments and the system of national accounts, which is crucial for the exchange and reconciliation of data coming from different sources in order to measure flows and costs of persons engaged in international travel. "Journey" is the activity of

travelers who move between different geographical locations for any purpose and for any period of time. A trip can be defined as a way of life of people who move from one place to another in order to develop the environment, which was the beginning of tourism. The journey has an economic effect mainly in the places visited by the traveler, and therefore becomes an important subject of economic analysis. Measuring the costs of persons moving from one country to another outside the country of their permanent residence is reflected in the balance of payments in the category of travel. [19] Participants of the United Nations Conference on International Travel and Tourism, held in Rome 1963, defined the visitor's term in two categories: a) tourists visiting one country and staying in its territory for at least 24 hours for recreation, business, health, education, participation in a mission or meeting or conference, visited I have friends and relatives, religious purposes or sports; b) tourists - people who visit one country and stay in its territory for less than 24 hours (cruise passengers, visitors to the country without accommodation, crews of ships, airplanes, etc.) For the first time the term "international tourist" was introduced in 1937 by the Committee of Experts On the issues of the statistics of the League of Nations. During the Inter-Parliamentary Conference on Tourism, held in The Hague (Netherlands), on April 14, 1989, the Hague Declaration on Tourism was adopted in co-operation

with the Inter-Parliamentary Union (IPO) and the World Tourism Organization (UNWTO) Tourism). The Declaration defines tourism as "the main instrument of international cooperation, the rapprochement between peoples and the factor of individual and collective development, which calls on parliaments, governments, public and private organizations, associations and institutions responsible for tourism activities, professionals in the field of tourism, as well as tourists themselves to take into account carefully its principles as they are described below, and constantly rely on them in their work "[20]. The Schengen agreement of the EU member states has abolished the restriction of passport control of the movement of its citizens among other territories. Today, all citizens of EU countries travel between countries of the "Schengen Agreement" on the internal passports. Freedom of movement and travel, the right to choose the place of study, work and leisure in other EU countries is a significant achievement of European citizens and the process of economic integration. Tourism is also a specific economic science, which is divided into theoretical and applied economics, examines individual spheres of the world and national economy. The theoretical tourist economy studies laws, principles, rules and models for generalizing all economic functions of tourism, and applied - a tourist policy for the purpose of developing a tourism economy in the country. In

particular, tourism is a sector of economic science that examines and studies mainly tourism demand and individual factors that shape it (tourist needs, tourist motifs, consumption patterns, decision making processes, etc.), tourism production, tourist value and tourist offer, individual factors that determine it (output, prices of industrial power price), and various economic relations at a certain time and place to meet the needs of tourism [23, p. 32].

1.4. Social and economic effect of recreational and tourist services for economic development

Regarding negative influences, unfortunately, the sphere of recreation and tourism can negatively affect the state of the environment. Economic development in the field of recreation is limited by the possibilities of recreational resources and the maximum allowable capacity of the recreational zone. A significant number of places to visit tourists and tourists, characterized by a weak ecosystem that can not withstand serious violations. Their natural and irrational use leads to environmental problems in the areas of active recreational development. That is why the traffic capacity standards are calculated for each territory separately, based on the specific features of the recreational zone. The selection of a site for a recreation center should include not only the consideration of the potential of this territory for the

reception of tourists, but also the environmental parameters for sustainable balanced development of the territory. Significant social and economic effect of recreational and tourist services for the development of the whole economy gives grounds to refer this sphere to the so-called public goods, which means the need to combine the possibilities of a market system of organization of economic activity in this area with well-considered state intervention. The nature of recreational services that is unique to health and life of consumers, the presence of significant positive and negative external effects of the functioning of recreation and tourism cause the need for state influence on the mechanisms of their supply and implementation. The imperfection of competition and the market mechanism is that they exclude from the consumption of these services significant needs and groups of consumers that can not be provided with money. In the pure market of recreational services, market self-regulation is not able to provide socially meaningful services. The achievement of the social effects of the functioning of the recreation and tourism sector is possible only if the state intervenes on the basis of the simultaneous application and combination of elements of the regulatory influence of public and state structures, as well as self-regulation of recreational entrepreneurs. Thus, the organizational and economic mechanism of development of the recreational and tourist sphere includes both the

establishment of general rules of operation, as well as a certain freedom of economic activity [39, p. 274-275].

The essence of the concept of recreation and tourism sphere and its structure is explained above. According to the logic of economic analysis, we are interested in the peculiarities and results of economic activity in this area, but at the same time there is no doubt social outcomes. That is why it is necessary to determine what should be understood by the concept of social dimension.

In the sociological encyclopedia, social measurement (English social measurement, sozialer messen,) is interpreted as an expression of various characteristics of social objects and the relationships between them in the form of numerical values. Social dimension is based on the system of indicators in the form of empirical indicators and mathematical symbols (indexes) [40].

In our opinion, this definition is one-sided, because social values can have not only social objects. It is the discovery of such social aspects of activity, social influences and effects is the subject of our study.

Thus, under the social dimension of the recreational and tourist sphere it is worth understanding the characteristics of the social aspects of its functioning.

Such a characteristic may be represented by a system of socio-economic indicators regarding the state, characteristics and results of recreation and tourism activities. Considering the importance for society and the wide range of results of the functioning of this sphere, it is useful to highlight, in our opinion, the following aspects of its social performance: positive and negative, internal and external, direct and indirect effects. Positive and negative effects. Positive effects are the impact on the improvement of various aspects of the life of the population and the economy as a whole, as discussed in detail above. Their list can be continued further.

Regarding negative influences, unfortunately, the sphere of recreation and tourism can negatively affect the state of the environment. Economic development in the field of recreation is limited by the possibilities of recreational resources and the maximum allowable capacity of the recreational zone. A significant number of places to visit tourists and tourists, characterized by a weak ecosystem that can not withstand serious violations. Their natural and irrational use leads to environmental problems in the areas of active recreational development. That is why the traffic capacity standards are calculated for each territory separately, based on the specific features of

the recreational zone. The selection of a site for a recreation center should include not only the consideration of the potential of this territory for the reception of tourists, but also the environmental parameters for sustainable balanced development of the territory. This issue is the subject of constant attention from domestic and foreign scientists, as well as the WTO, UNEP and other international organizations [41, 42, 43, 44, 45]. The negative impact of tourism on countries that do not have sufficient technical and financial capacity to replenish the resources used by tourists and eliminate their waste is often considerably higher than the damage done to the environment by the local population [46, 47]. The international community is increasingly concerned about the negative impact of tourism on the environment, namely: degradation of natural landscapes due to excessive consumption of resources; building of land; contamination of natural objects; a threat to wildlife and habitats of animals and birds; loss of biodiversity and, finally, violation of local customs and communities, etc. In this regard, the urgent task is to develop new models of environmentally safe development in the interests of the entire society. Internal and external influences. The social performance of the recreation and tourism

sector can be manifested at the domestic level, when the following results of its functioning are estimated: population coverage by different types of services, dynamics of revenues from sales of services, etc. In addition, this area definitely affects the external environment - the economy of the region and the country as a whole, reflected in the level of employment, the development of related industries, contribution to GDP, etc. [34]. The general algorithm for assessing the social performance of recreation and tourism should include the following steps:

- estimation of nature-recreational potential, analysis of the state of recreation and tourism infrastructure, labor-saving provision;
- definition of the system of indicators and analysis of social performance of the sphere;
- development of proposals for strengthening the social direction of functioning and development of recreation and tourism sphere.

The results of analytical research are the basis for constructing the concept of its development, which includes the setting of priorities of recreational and tourist activities, the main directions of its implementation and optimization of the location of objects (their combination and layout). The

development of such a concept should include certain social priorities and goals, and build on existing natural, human, technological and material potential. Since the 90s, under the influence of the processes of the expansion of market relations and humanization of research increasingly focus on the study of spatial patterns, features of recreational activities and the placement of recreational facilities. During the last 10-15 years there were transformations of recreational and tourist needs of the population, spatial structure of recreational and tourist systems, organizational and legal forms of activity in this sphere continue to change. The optimum development of the latter requires both the use of market mechanisms and a balanced public-public influence in order to minimize the negative effects of market economy. That is why environmental and sanitary norms of use of nature-resource potential, coordination (harmonization) of interests of local residents and tourists and recreational resources of the territory are important. Recreational zones have their own borders, which often do not coincide with administrative territories. This necessitates the construction of an appropriate management system for different recreational areas that may be part of the administrative territory or cover even parts of different regions. Management of

recreational zones must necessarily take into account their size, functional purpose, geological, landscape, ecological, cultural-historical and other parameters. The successful functioning of the recreational zone involves the creation of an efficient transport, information, energy, water supply and sewage, service and other infrastructure. The main problem is that all this together does not harm the nature-resource and ethno-social potential of the recreational zone [48, 49]. That is why the main goal and the defining principle of effective and socially oriented management in the field of recreational and tourist activities should be to ensure maximum satisfaction of visitors while minimizing its negative impact. The basic concept in determining the optimal ratio of the use and conservation of nature-resource potential is the so-called capacity of the territory, that is, the level of its use, which it can provide, provided that the high level of satisfaction of tourists and tourists and the insignificant influence on resources remain. Bandwidth is estimated by many criteria and is determined primarily by administrative decisions. At the same time, natural, social and managerial factors are decisive. The formula for assessing the throughput potential of the recreational use area is traditionally based on the average standard expressed in $m^2 /$

person. However, it is difficult to calculate, and carefully in each particular case, since it covers at least three unknown capacity - material, psychological and environmental. Current scientific tasks in this area are the calculation of the threshold values for the degradation of recreational zones from the number of visits. This involves taking into account the quality of soils (from sand, loamy to chernozem), the type and density of forest plantations (steppe vegetation, coastal strip) and other factors for temperate climates, in particular the determination of the ability to recover from anthropogenic pressure. These values are individual for each recreational zone and are experimentally. Similar data in other climatic zones may have an effect different from those obtained in temperate climates. Estimated thresholds for environmental degradation can be applied with known approximation for any region of Ukraine, which will enable planning and creation of recreational zones with the expected limit of the flow of visits, that is, the capacity of recreational facilities. The complexity of research data is that such developments are carried out by teams of scientists, which includes specialists of various profiles - from soil biochemistry to climatology. Such an order for science throughout the country is only possible in the recreational sphere with

its budget for research work. In this regard, the question arises of scientifically grounded regulation of recreational loads on recreational zones. The only method of determining the load on the environment is not only in our country, but also abroad. Modern authors simultaneously use the terms anthropogenic load and bandwidth potential, or adequate optimal load [50, p. 166]. The greatest load that can withstand the recreational facility without serious damage to local resources, the negative impact on the impression of travel and the emergence of socio-economic problems in the population - is the bandwidth potential of the territory. Such a load on it, which does not lead to the ecosystem to the limiting state and, as a result, irreversible changes, represents the limit of environmental tolerance, and not the limiting value of limiting factors. The optimal load characterizes the recreational zone along with the quantity and quality of recreational resources in terms of the level of caused or expected damage (pollution, logic, noise load, state of health of the population). In determining the optimal load or capacity of a specific recreational zone, in addition to assessing anthropogenic impact on natural biocenoses, the health of the local population and recreation should be taken into account. The capacity of the recreation zone is increasing with the

reduction of anthropogenic load on natural and recreational resources, which also depends on the qualitative level of environmental technological processes and the ecological consciousness of society as variable variables (the influence can be positive and negative), and to a lesser extent - from the capacity of the recreational zone. From the point of view of the link between the socio-economic and environmental factors that restrict the use of the territory, it is necessary to take into account the minimum burden on recreational resources. The latter has a cost-effective meaning and takes into account such a visit to the recreational zone, which allows the return of investments spent on the construction of all objects, environmental protection and operating costs [51, p. 115-116]. Foreign and domestic scientists in the most general form have defined approximate normative indices of recreational load for various natural complexes. In Ukraine, the throughput potential is considered acceptable if it meets the requirements of the State Construction Standard DBN-360-92 for recreational territories. However, he insufficiently takes into account the impact of recreational loads on the environment and shows a rather negligent attitude in our country to the natural heritage. There are also norms of recreational loads depending on the stage of

forest aggregation in different conditions of their growth [52, p. 108-109]. In the calculation of the throughput, it is necessary to take into account such natural factors as the size of the territory and the area suitable for recreational activities. Often only a small part of a large area is reserved for recreation. The optimal load (capacity) also depends on the load norms, the time of stay of the tourists within its limits, the duration of the favorable weather period.

According to scientists, it should be determined for each season [53], as well as the capacity, which depends on the scale of the tourist center, the natural conditions, the value of recreational resources. It should be noted that the greatest threat to natural ecosystems is the recreational activity outside the recreational complex, that is, in the area of regulated recreation of national natural parks (NPPs), which, according to its purpose, is an ecotourism zone of a natural park. According to the results of the analysis of the methods of calculating the optimal recreational load [42, 44, 54, 55], it is advisable to calculate the capacity of the territory not in area, but on the basis of linear loading (the recreational capacity of the paths with rest areas).

In particular, L. Kobanets gives a formula for

determining the capacity of the zone of regulated recreation (ecotourism recreational area):

$$C_r = \frac{S_{rpj}}{K_c \sum_{i=1}^n W_i L_i + \sum_{j=1}^m N_d \frac{T}{t}}, \quad (1.1)$$

where C_r - optimal recreational load, person / day;
 K_c - correction coefficient, taking into account violation of plant cover, consolidation of soil during laying and improvement of tracks (from 1.5 to 2.0 for broad and narrow stitches, respectively);
 W_i - width of the trail on the i -th section of the route, m (usually 1,5-2,0 m);
 L_i - length of the i -th section of the route (between nodes of the network), m;
 n - the number of sections of the network;
 S_{rpj} - the area occupied by the j -th object of the show, the rest point, etc., in m^2 ;
 m - the number of objects of the show, the points of rest;
 N_d - norm of distribution of resters along the paths, which prevents physical and moral discomfort while passing the route (depends on the curvature, the width of the path, the type of vegetation, the fauna, etc., to be determined in each case separately), person / m^2 ;
 T - duration of the world day, h .;
 t - average length of stay in a recreation zone, hour /

day [55, p. 102].

In this case, the uniformity of the distribution of tourists and tourists along the tracks, which in the world practice is carried out by means of monitoring, is of special importance. To this end, a number of measures are being taken, including timely (possibly temporary) closing of overloaded areas and encouraging visits to vacant ones. Through managerial decisions, it is possible to increase the throughput, including through the planning of paths for the purpose of wider distribution of tourists and tourists through the territory of the natural park; reduction of contradictions between competing types of use (for example, allocation of sites for special campsites, green hotels and parking lots for unorganized tourists); carrying out of informative and explanatory work; increasing the strength of renewable resources (for example, materials for road surface); construction of accommodation and servicing of tourists and tourists, development of incentive policies for visiting the park in the off-season period [56]. Thus, the introduction of a methodical linear approach to the calculation of the recreational capacity of natural areas, together with the creation within the natural parks of recreational and tourist enterprises of an innovative type (annual water parks of high capacity) and the levying of rent

for the use of natural recreational resources from enterprises, will promote the sustainable development of recreational and tourist activities in natural parks, improvement of economic-ecological and social conditions in the regions. In determining the most urgent directions of development of recreational and tourist research in the social aspect, one should pay attention to the following:

- formation of the concept of sustainable development of recreation and tourism at different territorial levels; study of tourism and recreation as systematically organized phenomena, analysis of modern trends in their development;

- development and standardization of a comprehensive methodology for assessing the tourist and recreational potential of the territory at the national, regional and local levels;

- scientific substantiation of boundaries, models of designing and development of tourist and recreational special economic zones taking into account allowable recreational loads;

- development of the mechanisms of management of recreational zones on the basis of the formation of a system of statistical accounting, processing and analysis of tourism data, development of information and reference and mapping of recreational and tourist

activities;

- Creation of short-, medium- and long-term forecasts for the development of regional and local recreational and tourist markets on the basis of their monitoring [57-64]. Determining the optimal loads of recreational zones plays an extremely important role in terms of implementation of environmental development of territories. Another relevant aspect of computing the social performance of the functioning of recreation and tourism is the implementation of social diagnosis, which requires an appropriate algorithm for determining the social results of different spectrum. The process of determining the social indicators of recreation and tourism activities is expedient to carry out in stages: collection of primary information, its processing and analysis, identification of problems, ways of their solution and priorities. Depending on the purpose and the specifics of the investigated processes, both general scientific and specific methods can be used.

At the stage of processing and analysis of information, in fact, diagnostics of problems, factor analysis, comparison of various information, etc. [65]. The term diagnosis (from Greek: diaghostikos - the ability to recognize) is most often used in medicine to determine the process of recognizing the disease, establishing a

diagnosis [66]. That is, social diagnostics involves identifying the degree (level) of conformity (inconsistency) of the actual parameters of the social situation (number of resources, quality of objects, prevailing social settings), social expectations (reference model of the social object), followed by a comprehensive study of the causes of the existing deviations. The tasks of social diagnostics - to collect, process and analyze the state of the social sphere of the country in order to monitor the results of the socio-economic policy of the state and to develop proposals for making certain adjustments [67]. The concept of social diagnosis can be understood as a separate study of a social problem (situation) or a stage of a more comprehensive study aimed at obtaining information and substantiating recommendations. In the national sphere of recreation and tourism, it covers a range of measures, methods and methods of assessment that enable to determine the level of social well-being, the degree of satisfaction of users of services and subjects of its economic activity. At the same time diagnosis should be carried out on the basis of interdisciplinary connections of social work, economics and other spheres of scientific knowledge. The objectives of social diagnostics in the field of recreation and tourism are to clearly assess the state and identify

problems with the satisfaction and coverage of the population with tourist health services. Such an assessment is the basis for determining ways to expand the opportunities for people to use free time in order to improve their health, cultural awareness and sport activities, and predict further development of the recreational and tourist sector. Diagnostic function is one of the main in demography, social economy and politics. The task of social diagnosis is to identify the problems that need to be addressed in order to achieve the goal of improving the social aspects of life of the population. The purpose of social diagnostics of recreation and tourism is to establish those results that directly characterize the social aspects of the functioning of the investigated sphere in the economy. That is why the diagnostic task is first and foremost a definition of the frame of indicators that characterize the important social aspects of the functioning of the recreation and tourism. These indicators can relate to the characteristics of the actual operation process, and its results. In general, all aspects can be represented by a system of indicators for diverse and multilevel performance. These results may have, in the first place, an internal (from the point of view of the functioning of the sphere) and an external (value for the whole economy) character; secondly, direct

manifestation (the number of tourists, well-off persons, the number of business entities, etc.) or mediated - after a certain time (improving health, duration and quality of life of the population, etc.).

Thirdly, the detection of a given set of results is important not only in the current (up to 1 year) period. Indicative is the identification of general trends in the medium-term (up to 3 years) and perspective, strategic (up to 5 years or more) terms. Fourth, the whole set of resulting indicators can be conventionally divided into those that characterize the phenomena or processes in kind (the number of tourists, the terms occupied in recreation and tourism, enterprises, etc.), or in value (the volume of services sold, incomes sub ' objects of entrepreneurial activity, household expenses for rest and recreation, etc.).

Fifth, the analysis always involves a certain level of research (local, regional, or macro level).

The importance of social goals as guidelines for the development of recreation and tourism needs to be defined and clearly documented in public policy.

Moreover, the goals should be established both in the current period, and in the medium term and, of course, in the long run. Current (nearest) goals are outlined by the zone of the immediate development of the recreation and tourism sector. They determine the

achievements of local results, which nevertheless give the opportunity to create conditions for achieving the strategic goals of the development of the investigated sphere. The following may be the main objectives: increasing population coverage of recreation and tourism services in general and certain categories thereof, improving the quality of services, improving infrastructure, etc. Each subsequent (operational) goal envisages the possibility of more complete satisfaction of the needs of the population and economic entities in the field of recreation and tourism. Strategic goals are related to improving welfare, improving the quality of life of the entire population and human development in the country as a whole. Systematization of goals allows to more clearly construct a hierarchy of social goals, to specify work on continuous monitoring and to determine the effective ways of their achievement and implementation. Thus, the results of social diagnostics should become the basis for the decisions and recommendations adopted and further implemented in the management of the development of recreation and tourism. An analysis of the status and general trends of the population (total and individual groups) coverage of the relevant services, the number of economic entities, employment in this area and related industries is very important for

determining the social priorities of development of the recreational and tourist sphere. On the one hand, an increase in the number of people receiving high-quality health and tourism services is the basis for improving the quality of life of the population. On the other hand, the growth of entrepreneurial activity and employment in this area also have a positive social significance for the country as a whole.

The findings in the complex are important for setting socially significant goals and continuous monitoring of their achievement (Figure 1.5) at the local, regional and national levels. An important component of social diagnostics should be financial and economic diagnostics, aimed at assessing the financial status of business entities, analysis of price policy, the ratio of demand and supply in the market of recreational and tourist services, etc. Consequently, as a result, the range of questions for the study is substantially expanded and there is the possibility of solving complex strategic problems. Fig. 1.5. The totality of the goals of social development of recreation and tourism (developed by the authors)

In a market economy, recreational and tourist enterprises enter into a competitive relationship in the market of services provided. In order to avoid their

bankruptcy and ensure high competitiveness, constant and systematic financial diagnostics is required.

Economic activity of recreational and tourist enterprises is influenced by a complex of internal and external factors of financial support. Among the most effective are the following: the form of ownership and organizational and legal forms of activities of enterprises, the actual size of providing recreational and tourist services, financial status, the theoretical and practical possibility of attracting additional financial capital from different sources, strategic goals and current tasks of functioning over a certain period of time , financial policy of the enterprise, level of management, etc. Therefore, the following data are important for assessing the financial condition of recreational and tourist enterprises: the structure of service costs; the volume of financial results; the volume and structure of financial capital and sources of financial support; structure of accounts receivable and accounts payable; indicators of financial flows. The social significance of financial diagnostics lies primarily in the fact that the volumes of financial activity (and their trends) indicate the scale of entrepreneurial activity and its efficiency, the coverage of the population by services, the level of incomes of both entrepreneurs and consumers of

services. The analysis of financial indicators enables to substantiate conclusions about the dynamics of incomes of the whole population and entrepreneurs of recreational and tourist activity.

At a higher level of economic analysis, it is important to determine the contribution of this sphere to the gross regional or national product. On the basis of the generalization of the above, a systematized representation of the set of results and the corresponding indicators in the matrix of social diagnostics is presented (Table 1.2).

Indicator	Direct results	Indirect results
Internal results	Reach population with recreational and tourist services. Coverage of certain groups of the population by recreational and tourist services. Provision of employment in the field of recreation and	Improvement of health indicators and life expectancy of the population. Improving the quality of life of the population. Raising the cultural and patriotic level of the population. Implementation of a healthy lifestyle. Improvement of

1.5. Conceptual and theoretical models of economic regulation of the development of the regional tourist and recreational complex

Thus, as we have been recognized, the tourist-recreational complex is one of the most important blocks of the non-productive sphere of life of society - its social infrastructure, and tourism directly has a significant potential as an instrument of economic development of regions and the state.

Tourism is now one of the most dynamic sectors of the world economy. In particular, according to the forecast of the World Tourism Organization (WTO), by 2020 the number of international tourist trips will increase from 564 million a year to 1.6 billion, that is, almost 3 times; tourism revenues, in turn, will grow from \$ 399 billion. up to 2 trillion dollars in a year. Note that these indicators characterize only the

volumes of international tourism, which, due to a number of reasons, is to a large extent the object of attention of scientists, politicians and non-governmental organizations. The share of domestic tourism accounted for 80% of the total number of tourists in the world (according to the WTO, the ratio of domestic and international travel in the world by 2020 will be 10: 1) [61]. The task of effective economic regulation of the tourist-recreational complex is one of the priorities for the regions of Ukraine. This is especially true for territories traditionally specializing in tourism. The state is interested in the development of such territories, due to their uniqueness in performing the functions of health improvement and rest of the population. The system of economic regulation of the development of tourist-recreational complex includes subjects and objects of regulation. The ambiguity and versatility of the concept of the object of regulation of the tourist-recreational complex determine the complexity of management. The theory of economic regulation in its classical form offers a fairly clear definition of the object of regulation - this is what directed cognitive or other activities.

In this correspondence, the object of regulation is RTRK, which consists of three subsystems - "region",

"tourism", "recreation". Their complexity and ambiguity and their associated phenomena, relations and processes determine the difficulties and contradictions of the object being studied. At the same time, any of the existing tourist and recreational complexes has its history, stages of development, structure, internal organization, specialization in certain types of tourism and recreation, its advantages and disadvantages. In the process of tourist and recreational development of the territory of the TVK creation is inevitably and objectively necessary, since the TVK serves a higher stage of organization than separate tourist and recreational facilities (detailed in sources [89, 119, 160]).

The formation and development of the TVC is the transition from the "focal" creation of tourist and recreational facilities to their integrated and purposeful construction. As a rule, there are two groups of preconditions for the formation and development of TVS: natural and socio-economic. Natural is often the basis of the formation of TRC. They in the majority of cases determine the tourist and recreational specialization of the complex. For example, the presence of mineral springs, healing mud leads to the creation of balneological resorts (Karlovy Vary in the Czech Republic, Druskininkai in

Lithuania, Kislovodsk in the North Caucasus, Naftalan in Azerbaijan, Truskavets, Skhidnitsy in Ukraine); the picturesque combination of mountains, comfortable slopes, forests - to the organization of TRC, ski centers (Oberhof and Oberwiesenthal in Germany, Zakopane in Poland, Courchevel in France, Strebske-Pleso in Slovakia, Bukovel in Ukraine). However, today, based on the experience of Ukrainian regions and other countries, two main ways of economic development of TPCs are possible. At the heart of the first way are the former schemes for the placement of tourist and recreational facilities. In this way there are regions with historically formed tourist and recreational economy (Black Sea coast, Azov coast, Carpathians, etc.). The priority task for such regions is to restore, reconstruct and develop already existing objects. Recognize that the second way involves the new development of areas that previously did not differ in their concentration objects tourist and recreational purpose. The researchers identified three main options for the emergence and development of a new form of TRC:

1. Local natural resources serve as the main stimulator of the development of tourist-recreational complexes.
2. TRK is formed on the basis of large urban agglomerations with a highly developed economy

(Baku - Absheron Peninsula, Moscow region, recreational areas near Kiev, etc.). Residents of large cities form the demand for rest, and this affects the organization of recreation. Typically, these are regions with favorable economic and geographical location, developed transport network and production facilities capable of serving tourist and recreational facilities and mastering tourist and recreational potential. 3. TRCs are developed on the basis of the influence of social, national, historical, architectural, archeological, national and other factors (Suzdal, Vladimir - the cities of the Golden Ring in Russia, Mtskheta in Georgia, Venice in Italy, Golden Horseshoe in Ukraine, etc.).

In addition to the prevailing preconditions for the economic development of TPCs, which include the presence of local natural resources, a large urban agglomeration with a highly developed economy (for example, numerous recreational complexes may be used in almost cities) or specific national, historical, archaeological and other similar factors, it is necessary to highlight additional prerequisites that are relevant for the current stage of development of tourism as a specific lifestyle.

The first of these prerequisites is the presence of a relatively sparsely populated spatial complex, within

which the natural ecological environment typical for a given area remains. Such territories can serve as a base for the formation and development of specialized tourist and recreational complexes, users of which will be two main categories of clients. The first one - clients interested in environmental tourism - is the direction of the most dynamically developing tourism industry. The second one is consumers whose activities are connected with a large number of interpersonal contacts. On the basis of such growth points in regions, "unique" tourist and recreational complexes can be formed, the demand of which will be provided on the market with the growth of the number of identified second category of consumers. The second, discovered in the framework of this study, the precondition for the development of a tourist-recreational complex is the need for a certain category of tourists in acquaintance with the absence of specific national, historical, archaeological and other similar factors. An example of satisfaction of such a requirement from the point of view of international tourism is the growing flow of inbound tourism to oil in the countries of the Middle East (for example, Qatar), the characteristic feature of which is the lack of historical and archaeological values. On the contrary, the center of attraction of tourists in this case

becomes an opportunity to get acquainted with a culture that has no significant traditions, culture at the stage of formation, which is a particularly significant factor for tourists who represent civilizations with a long-established, well-established culture. On the basis of such growth points can be formed "dynamic" tourist and recreational complexes, attractive for clients who are interested in the processes of development of civilizational formations. Therefore, the identified preconditions allow us to determine that each meso-regional socioeconomic system has at least one growth point for the formation of a tourist-recreational complex on its territory, which is of fundamental importance for the development of a management system for the tourism industry and recreation in the region.

Next, it is necessary to identify the stages of economic development of the tourist and recreational complex, characteristic of each of the above types of TRC:

1. Simple agglomeration of enterprises of various recreation and tourism sectors (sanatorium, campus, camp).
2. Specialization of the territory.
3. Formation of the territorial structure of the TRC.

Depending on the main profile of the TRC, the following types are defined:

- 1) sanatorium and resort, which includes specialized sanatorium and medical institutions (sanatoriums, hospitals, hotels (with special equipment rooms), dietetic food companies). Persons of the specified type of TRC must be staffed with doctors, middle medical personnel, massages and other specialists of the corresponding medical profile (necessary medical equipment and special transport);
- 2) tourist and recreation, which includes holiday houses, tourist hotels, bases, camps, shelters, motels, campsites, hire points for tourist and sports equipment, ski lifts, horses for rent, skiers' schools, mountaineers, horse riding, sailing -recreational complex: instructors of tourism, mountaineering, skiing, conductors, porters of mountaineering equipment);
- 3) hunting and fishing, which is aimed at the use of such facilities for accommodating holidaymakers: shelters, hunters' houses and fishermen, as well as such facilities as boat stations, inventory rental, smokers, etc. (frames: seagers, conductors, etc. Special transport is required - snowmobiles, horses, carts next to motor vehicles, helicopters);
- 4) Combined, combining the features of several others (given its complex nature, the TRC has a complex production, economic, social and infrastructure

construction).

For example, neoclassical theory more closely coordinates the factors of development and technical support, and explicitly focuses on the development and implementation of technical innovations.

Technical progress lies at the heart of expanded reproduction, generates opportunities for the creation and consumption of goods in the future [104].

Improvement of technical conditions of production takes place on the basis of introduction of "technical innovations". This process causes a reduction in production costs and prices, an increase in profit margins, an increase in wages and an increase in production. As driving factors of technological progress are considered: demographic factors, transformation of needs, toughening of competition [138]. The neoclassical school, speaking with the thesis "the will of entrepreneurship", has always advocated the need to increase the number of innovations in the economy. Neoclassicists introduce differentiation of production technologies, substantiate their different profitability, agree on price aspects of the use of certain technologies [11, 104]. However, the neoclassical direction considers not only the improvement of production technology, but also the creation of new products and services, which

determines the impact of different types of innovations on economic development.

We believe that the reproduction of RTRK requires clarification that the main purpose of its development can be defined as the formation of a competitive TRC as one of the leading branches of the territorial specialization of the region. The indicated branch provides the growing demand of consumers for the satisfaction of their needs in tourist and recreational services. Its functioning makes a significant contribution to the socio-economic development of the region by increasing the revenue part of state and regional budgets, inflow of investments, increasing the number of jobs, improving the health of the population, preserving and rational use of cultural-historical and natural heritage. An important role in this is played by the system of regulation of the processes of providing services to the public transport company, regulating the methods and functions of the system, the subject-object relations of the complex, the relationship between service and information technology. These technologies, possessing high transformational capability, allow to effectively coordinate the dynamic situations inherent in the field of recreational services. A well-established management system provides the basis for the most effective integration of the execution of individual operations for services. For example, within the regional TRC, it is possible, using the principles of

planned budgeting, to build an effective scheme for redistributing (allocating) financial flows from more profitable sectors (entertainment, etc.) to less cost-effective (for example, placement facilities) in order to sustain the economic development of the entire PCU. The significance of the formalization of such a scheme for the implementation of the function of macroeconomic regulation is determined by the fact that the TRC provides the needs for relevant services not only for visiting tourists, but also for the local population, thereby contributing to a significant improvement in the quality of life in the region. Economic entities of the tourist and recreational complex, providing services, accumulate service functions at the level of structural units that form a hierarchy of management. Therefore, the system of management of operational processes of the TPC as a whole and its individual objects should consider the possibilities of the coordination and integration of service processes of related economic entities, the need and reserves of expansion of production capacity of TPC, increase in productivity and improve its quality. This is ensured by the interconnection of the production, investment and innovation potential of the economic entities included in the complex, in the implementation of which the achievement of the main

goal occurs with the best performance indicators of service production. The tasks can be successfully implemented by applying the following methods:

1. Reengineering as a method of increasing the efficiency of economic development of economic entities TRK. At the heart of improving efficiency of production organization of tourist and recreational services are optimal management solutions to most accurately determine the correct ways to achieve the goals and structure necessary resources. The development of decision-making information systems requires the creation of methodological bases for their functioning to accurately determine the feasibility of performing certain types of services. The created information systems provide a lot of incoming information channels, which include the results of marketing research, which form portfolios of orders, regulatory and legal databases. Reengineering abrupt allows significant improvement of businesses, provide them with necessary and sufficient information to make decisions in planning and regulation. Therefore, it is necessary in orientation of the subjects of the economy to radical changes in the main economic indicators, such as cost, quality, speed of service. Reengineering implements the properties of the information and decisive system of production of

tourist and recreational services, the main content of which are information flows. The role of the latter is to ensure the flow of business processes in the given optimal modes based on the principle of feedback. Feedback system is provided by analyzing the quality, quantity and cost control provides posluh. Vyhidnyy present relationship throughout the period of service, allowing you to make adjustments to the regulation process of production services and thus increase its effectiveness. Initial control involves processing and analysis of information on the tasks performed from different workplaces, identifying insufficient information and comparing it with the plan. Decisions on routine (routine) actions are taken by the system of economic regulation on the basis of developed instructions (methodologies) for the provision of services throughout the range of services. The external environment, changing the production situation, dictates the change of methods and instructions, service schemes and database maintenance. The system of economic regulation compiles reports and reports for top management managers in order to form new economic goals and objectives. Over time, the system adjusts the functioning of both evolutionary and spin-off development of the service sector, assesses the organization of production services,

decision-making process and the choice of tactical, strategic goals and means of achieving them. Thus, the technique of reengineering involves a radical reorganization of the whole production process on the basis of its design from the initial to the final events in order to increase the efficiency of tourist and recreational production. It is expedient to use reengineering in the case of identifying unfavorable tendencies for their activity in the field of financing, competitiveness, profitability and level of demand. Many regional economic actors are now losing traditional segments of consumers, as competing economic entities respond better to the requirements of the market environment and are better adapted to demand and market conditions in general. One of the reasons for the ineffectiveness of the activities of regional economic entities is the weakness of financial regulation, the lack of flexible management structures, which adversely affects the overall level of business activity and the sustainability of economic growth in the region. In these conditions, cost management should be geared towards fixing variable and fixed costs, regulating fixed costs, and compulsory valuation of variables. To implement these tasks, it is advisable to use the principles of reengineering. It should be borne in mind that the implementation of

reengineering is also carried out by successful economic actors who are immediately responsive to changes, whose task is to quickly build a gap between the closest competitors and create unique competitive advantages within each PCS.

The method of regulating incomes of economic entities of the tourist and recreational complex is known now. To improve the financial performance of tourist-recreational economic subjects, the use of the method of income regulation is directed. It is well-known that tourist and recreational services are not subject to conservation or accumulation, so the income management method is aimed at optimizing the sales of a product that is not stored. This regulatory tool involves the use of real time as the primary time criterion. In practice, for adjusting incomes, you must set flexible prices for one and the same product, the values of which depend on the sales date of the product and the time when this product becomes useless. This leads to the need to develop appropriate tariffs for the services offered and the allocation of certain volumes of these services, ie so-called quotations. The method of income regulation can be used by tourist and recreational economic entities of different profile, taking into account their specifics. This method has the following advantages:

a) improving the financial and economic indicators of economic entities by adapting to the market in real time mode and taking into account possible changes in the absence of a clear segmentation of consumers; b) qualitative adjustment of the marketing policy of economic entities based on the modification of the marketing strategy, if its direction does not correspond to promising changes; c) maintaining a flexible pricing policy by developing a variety of tariffs that allow consumers to take full account of consumer demand; d) increasing the competitiveness of the market for tourist and recreational services due to the diversity of the price offer; e) increase of profitability of each service of the nomenclature of the enterprise.

Despite the convincing advantages of the method of regulating incomes, he has not yet received the proper distribution in the practice of domestic enterprises of tourism and recreation. This is due to the lack of market research, the bank of customer statistics, the inadequate qualification level of service and management personnel. At the same time, foreign managers, using this method, seek to increase the income of one service by 3-5% in high season.

Note that the full revenue management system should include a number of elements such as a database, an analysis and forecast module, an optimization module,

a diagnostic module, a user interface, and an interface with other systems. The use of a revenue model should provide the principle of integrity, on the basis of which the system, in the event of deviations, issues an appropriate warning to managers, and automatically introduces certain changes that allow optimizing the financial result of the enterprise. It should also indicate the important role of the capital structure of economic entities of the tourist and recreational complex in the economic regulation of the development of RTRK. According to what we note, in today's economic conditions, the management of the formation of sources of funding for the activities of economic entities of the tourist and recreational complex and the justification of the optimal parameters of capital for any economic entity within the RTRK actualizes the problem of establishing its structural proportions, the connection of which with the final results of the activities of economic entities significant.

Then, by optimizing the ratio of molded equity and borrowed capital, a sufficient level of financial profitability is ensured, a stable financial equilibrium of tourist-recreational economic subjects is maximized, and their market value is maximized. On the basis of optimization of the structure of sources of

capital attraction, a significant increase in the level of solvency of economic entities is ensured. The capital structure plays a prominent role in shaping market value by regulating the weighted average cost of capital. At the same time, in equity, should be considered not only the originally invested joint stock, equity or individual capital, the formation of the authorized capital of the enterprise, but also its accumulated part in the form of various reserves and funds, as well as the expected reinvestment of retained earnings. Accordingly, borrowed capital should be considered in all forms of its use, including financial leasing, commercial credit, internal payables. A more detailed structure of capital allows us to explore the features and develop appropriate recommendations not only for large economic entities, but for medium and small enterprises, whose access to the long-term capital market is limited. In this case, the role of the capital structure in ensuring the growth of the efficiency of the use of aggregate assets of economic entities can be eliminated. Effective capital formation in the context of its separate types is the most important condition for ensuring financial stability of economic entities. The rational structure of the formed capital allows to reduce the level of financial risks of activities of economic entities and prevent the threat

of their bankruptcy.

It should be noted that the assessment of the genesis of theories of the structure of capital shows that the most acceptable to the practice of financial management of economic entities is a compromise concept of the structure of capital of economic entities. The compromise concept of capital structure, based on the studies of Miller, R. Masilliss, J. Warner and some other contemporary economists, includes in the mechanism of formation of the capital structure a number of real conditions for the functioning of the economy and the market: the factor of profit taxation, the risk of bankruptcy of economic entities, full the cost of borrowed capital, including the initial cost of its involvement. These factors in aggregate form a certain ratio of the level of profitability and the risk of using the capital of an economic entity for its different structure. At the same time, the level of profitability of the used capital is characterized by an indicator of its weighted average value, which takes into account operating expenses for attracting some of its elements in the capital market. The level of risk of used capital forms the indicator of the proportion of debt capital in its total amount, generating at certain values the threat of bankruptcy of an economic entity. Significant contribution to the development of the theory of

economic growth was made by R. Solow. They developed two models: a model for analyzing the sources of economic growth and a model that reveals the interconnection of savings, capital accumulation and economic growth. The basis of the first model was the production function of Cobb-Douglas. It was modified by introducing another factor - the level of technology development. The acknowledged fact is that the economic crisis of 1973-1975 contributed to the formation of a new trend - post-Keynesianism, whose leader is the representative of the English Cambridge School J. Robinson. The originality of Post-Keynesianism as the independent flow was most clearly manifested in the development of the theory of economic growth and product distribution, which is based on the idea that the growth of a social product depends on the distribution of national income, which, in turn, is a function of capital accumulation. It is the rate of capital accumulation that determines the rate of profit, and hence the share of profit in GDP. The share of wages is defined as the residual value

Modern theories of capital structure are an advanced methodological tool for optimizing this indicator, the main criteria of which are: a) acceptable level of risk in the activities of economic entities;

b) maximizing the market value of economic entities;

c) minimization of the weighted average cost of capital of economic entities. The choice of a specific optimization criterion is determined by the economic entity itself, but the indicator of the weighted average cost of capital is the key. In general, capital cost indicators of economic entities are an important tool for substantiating managerial decisions aimed at increasing the rationality of their capital formation and the effectiveness of financial and economic activities of economic entities. The expediency and effectiveness of managerial decisions related to the use and formation of assets of economic entities of the regional tourist and recreational complex, as well as their sources, is reflected in the system of evaluative indicators of financial sustainability and self-financing of a certain TRC. Expanding the scope of the self-financing principle, which means providing financial resources at the expense of its own sources, such as depreciation and profit, allows to improve the organization of tourist-recreational production, including the updating of fixed assets and structuring of assets with a flexible response to the needs of the market tourist and recreational services that actualizes the necessity of expanding the processes of reproduction of fixed assets on the basis of intensification of investment policy regional On the

tourism industry.

Increasing the effectiveness of the organization and economic regulation of the development of RTRC should increase its budget-making role at the regional level, which may also affect the regional specialization. Organization of tourist and recreational production of the region requires a serious centralized intervention by the state in the economic mechanism of development of RTRC. This is confirmed by the need to ensure those socioeconomic processes that are related: a) maintaining the living conditions of recreational enterprises on the basis of legal implementation of economic decisions; b) with the implementation of stabilization measures (regulation of the economic development of sub-sectors of the tourist-recreational complex, encouraging progressive changes in the regional structure of the TVB); c) implementation of socially oriented redistribution of resources (providing recreational services to people with low incomes). To do this, it is necessary to provide tourist and recreational production with analytical, indicative-planning, programmatic and other justifications for improving the proportions, balancing the structure of the production of tourism and recreational services and its placement.

Improvement of the system of economic RTRC,

coordination of organizational and economic functions TRK taking into account the use of economic management methods can solve a number of interrelated tasks. These include provision of high-quality recreational services to the population of the region, profit making as the main internal source of financing for enterprises, and ensuring the positive impact of the tourist-recreational complex and infrastructure on increasing the potential of the region's economy. The regulation of the development of RTRC (road construction, hotel and resort complexes, the construction of new recreational areas) requires large capital investments and is financed from various sources (state structures, private organizations (domestic and foreign), international organizations, etc.). The growth of production in the tourism sector has a positive effect on other sectors of the economy, where investment activity is being developed, new jobs are created, trade turnover is expanding and, consequently, profits are increasing. Part of the income received comes to the state in the form of taxes. The money collected in this way may be directed towards further financing of tourism infrastructure, provision of material assistance to socially vulnerable groups of the population, and the development of a training system for tourism services.

TRC should be considered as an economic category, expressing a set of interrelated industries and industries of the regional economy, the only functional task of which is activity, aimed at meeting the diverse and constantly growing needs of people in different types of recreation and travel in their free time with the rational use of all available tourist resources. Thus, we can say that for today's economic regulation of the development of the economy is characterized not so much the development of isolated branches, but the operation of various inter-sectoral complexes. To TRK should be treated as an independent interdisciplinary economic complex of the economy, since the sphere of tourism, combining various branches, lies not in the usual vertical plane, but covers a certain horizontal space, including economic entities of branch affiliation. It should be noted that the state, in accordance with the Law of Ukraine "On Tourism", recognizing tourism activity as one of the priority sectors of the economy of Ukraine, promotes tourism activity and creates the necessary conditions for its development; defines and supports the priority directions of tourism activity; shapes the image of Ukraine as a country favorable to tourism; carries out support and protection of Ukrainian tourists, tour operators, travel agents and their associations. At the

same time, an important role in realizing the goals of macroeconomic regulation of the development of the tourist-recreational complex is played by the applied model of organizational construction. Thus, in some countries with a developed market economy, there is no body that carries out state regulation in the given industry, giving entities the right to make operational regulation themselves (for example, in the United States in 1997, the state administration was abolished, dealing with issues development of tourism industry). The regulation of problems that arise in the course of interaction between enterprises of the tourist and recreational complex between themselves and organizations of other sectors is carried out by general civil law methods based on the principles of market self-regulation. Public authorities can intervene only if there is a serious contradiction. Thus, with the development of the recreational and tourist sphere on the principles of the concept of reengineering tourist and recreational potential on the basis of the implementation of the technology of economic regulation of the regional economic complex, this area will generate funds, some of which can be spent on the protection of nature and traditional culture. The author acknowledged that the successful application of this concept implies: a) high level of efficiency of the right

regulation of economic relations in the conditions of market interaction; b) the presence on the market of tourist-recreational services of large companies; who are able to initiate and independently carry out large-scale projects; c) high attractiveness of recreational and tourist resources for potential tourists and visitors. In addition, we note that in countries where the state regulation of the market for tourist and recreational services is present, two models are implemented: specialized state bodies are created or regulated by the multidisciplinary authorities. The first model is implemented in countries where the share of tourism accounted for the bulk of foreign exchange earnings and involves a large-scale participation of the state in the development of tourism. In countries implementing the second model (mainly European countries), the development of the tourist-recreational complex is engaged in multi-sectoral ministries, most often economic entities, which generally address general issues of state regulation. In macroeconomic regulation of the development of the tourist-recreational complex there are two levels - state and regional. And in the first and second levels different forms and methods of regulation are used. At the same time, some forms and methods are inherent in only one level, which is determined by the division

of powers in this sphere between the state as a whole and regions. Macroeconomic regulation of the development of the tourist-recreational complex is realized through both administrative and financial and economic methods (Fig. 1.5), in which various regulatory instruments (licensing, technical regulations, tariff and price regulation, tax rates and benefits , customs duties, state investments, loans, subsidies, subsidies, compensation, etc.).

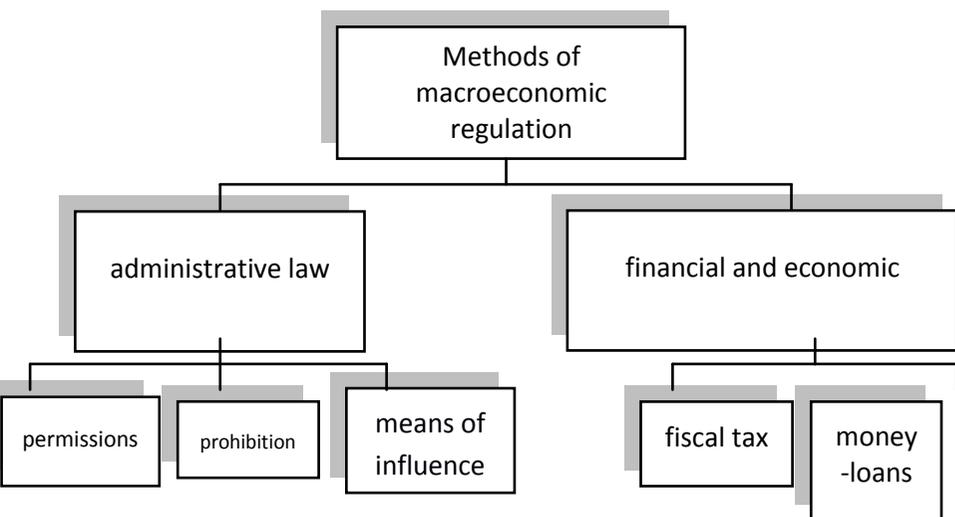

Fig. 1.5. Grouping the methods of macroeconomic development regulation tourist-recreational complex (author grouping)

For example, administrative legal methods in the context of economic regulation are used to create certain "rules of the game" in this area and are based on regulatory actions for the provision of legal infrastructure. They limit the scope of the behavior of economic agents and are often strict. Financial and economic methods do not restrict freedom of choice, giving the subjects of the recreational and tourist industry the right to freely decide. Therefore, in order to improve the process of macroeconomic regulation, in our opinion, we should primarily rely on the economic methods of adjusting the purpose-oriented development of RTRK, and the methods of direct administrative influence should apply only in exceptional cases. Since regulation is one of the functions of management, it is carried out by the executive authorities in the field of tourism. At the state level, such a body is the State Agency of Ukraine for Tourism and Resorts (State Tourism and Resort of Ukraine), a central executive body whose activities are directed and coordinated by the Cabinet of Ministers of Ukraine and the Ministry of Infrastructure of

Ukraine, which is part of the system of executive power bodies and ensures the implementation of state policy in the field. tourism and resorts. In any case, the structure of the executive body of the state entity in the field of tourism should be optimally consistent with the scope and nature of the tasks entrusted to this body.

In order to exit the recreational and tourist sector of the regional economy from the crisis state in which it is now, its structural adjustment, transition to the principles of sustainable (ecologically balanced) recreational and tourist use of nature in the respective regions is necessary.

And, accordingly, for the urgent transition of regions to sustainable development, it is necessary to formulate certain conditions for the creation of the appropriate regulatory framework for the balanced functioning of the RTRC. In this regard, it is worthwhile reviewing the regulatory documents regulating the placement, service, environmental protection and cultural and historical monuments, personnel training and other issues that regulate recreation and tourism activities.

Functional-structural scheme of economic regulation of the development of RTRK, reflecting it as a socio-economic phenomenon and the process of sustainable

use of the natural potential of the regional economic complex of recreation and tourism, is shown in Fig. 1.6.

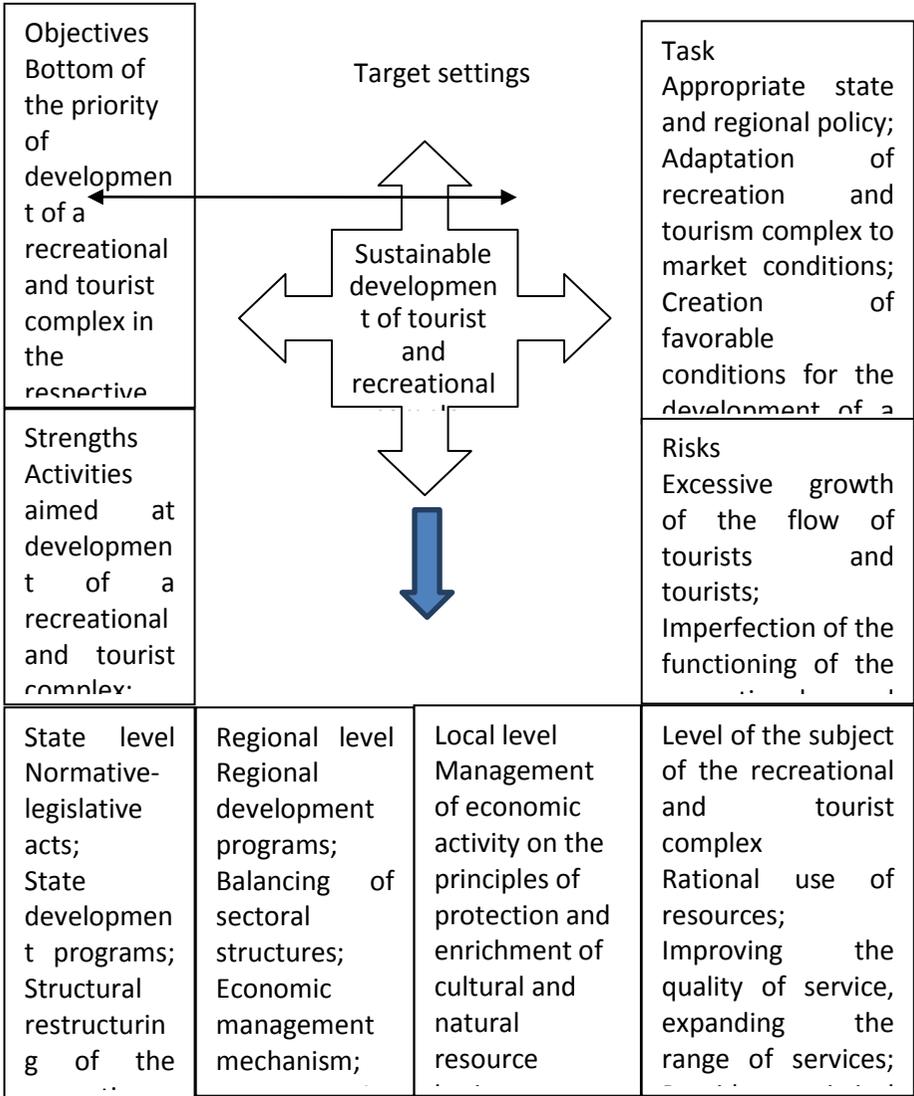

Fig. 1.6. Functional structural-logical scheme of economic regulation of the development of regional tourist and recreational complexes (according to [250])

At the same time, in order to increase the effectiveness of RTRC measures, it is necessary to apply a systemic approach to the issues of defining a strategy for development and developing measures of regulatory influence of the state. In these conditions, the generally accepted and effective method of support is the development and implementation of state and regional targeted programs designed to ensure the development of certain sectors of the economy of strategic importance to the regions and the country as a whole. In each case, forecasting should include certain quantitative target installations for the future, and among them priority should be given to the quantitative indicators of the tourist flow and capacity and indicators of occupancy of the resorts and the complex as a whole, as well as ayavnym medical and natural tourism resources.

In the forecast it is also necessary to reflect both the possible dynamics of the reproduction of resources, and the process of regulating their consumption in terms of optimizing the corresponding inter-sectoral

and intra-industry proportions. In this regard, the construction of the forecast should be carried out using, firstly, the genetic method of forecasting, based on the study of the current situation, and existing trends, and secondly, the normative-objective method, which involves obtaining the intended result in the orientation on the optimal use of natural resources, including environmental ones.

Thus, the modeling of the TRC structure involves the use of the entire system of consumption standards for tourist and recreational services, taking into account the principles of economic and statistical analysis recognized by the scientific community of the leading countries of the world (NUTS) in the context of the formalization of complex socioeconomic systems with branched warehouse and the different nature of economic activities. The above will ensure the combination of goals in which each component is involved, with the necessary factors for it (ie, resource support).

It should be admitted that the methods of supporting the TVB by the state can be both direct and indirect. Direct support can be expressed, for example, in the form of a public loan to a tourism organization, and training for such organizations is an indirect form of support. In these conditions, market participants of

tourist and recreational services provide promotional activities and promotions of special significance. Advertising in tourism is an effective means of disseminating information about a regional tourist product and serves as an effective tool for creating an image attractive to the tourism and recreation of the region. However, due to the lack of sufficient funds for advertising and promotion, there is no possibility of creating an informational and advertising environment that characterizes regional products. The existing amount of information can not fully provide an idea of the possibilities of the regional TV and radio station, as well as solve all the existing problems of advertising and information activities in this area. Thus, analyzing the directions of information provision of macroeconomic regulation of the tourism industry, it is necessary to emphasize the important role of statistical information in the analysis and identification of socio-economic significance, trends, factors of tourism development. At the same time, the modern methodological base of official statistics does not allow obtaining reliable and complete information on the state of affairs related to the creation of tourism product industries (material and technical basis, number of employed, financial performance, funding channels).

We recognize that an important component of the macroeconomic regulation of the tourist-recreational complex should also be the state policy aimed at supporting the entrepreneurial sector in the recreation and tourism business. At present, such support for entrepreneurship (including small ones) in the tourist and recreational complex in the regional practice is virtually absent or insignificant, unlike the world experience.

In addition, despite the existing known, declared by various legislative and regulatory acts tax, financial, administrative and other methods of state support of the entrepreneurial sector, the level of implementation of these methods and instruments of state support is insignificant. In addition, the methods of supporting entrepreneurship in the region currently used do not include sufficient tools that take into account the specificity of the functioning of the TPC, which impedes the full development and more efficient use of TPP in a particular region, nor does it promote or encourage the inflow of additional investment in this sector of the economy. Therefore, in order to improve and objectivize the economic and statistical accounting of the scale of the development of TPP and the analysis of the reliability of the operation of the TPC, it is possible to propose a number of areas of

organizational and economic activity of the subjects of management, which, in our opinion, should contribute to improving the quality of information provision of state bodies that perform functions the regulation of the tourism industry, the representatives of TRC and researchers involved in the study of this complex (Table 1.5). In this connection, it is necessary to emphasize the economic interest of tourism and recreational business participants in the implementation of measures for the further development of tourism and recreation, which can be achieved using the following forms of state support: 1) creation of favorable conditions in tourist-recreational areas and centers of the region different set of privileges provided; 2) ensuring easy access to financial resources under preferential lending, including with the provision of state guarantees; 3) stimulating the creation of new ones and the preservation of existing jobs.

Another important direction in ensuring the effectiveness of the macroeconomic regulation of the RTRC is the creation and application of a legislative framework that can provide conditions for the development and operation of various destinations for the tourism business. Due to the specificity of the implementation of special functions of the TRC within

a certain region of the state, the availability of complex multi-sectoral structural connections requires the use of an integrated, multi-faceted approach to issues of legal regulation. However, in addition to the adoption of special legislation, in order to create an effective legal system in the field of tourism and recreation, development and other areas of legal support (transport, trade, tax, investment, etc.), aimed at stimulating tourist activity and ensuring the coherence of all rules of law, are also needed. , which regulate relations in the tourist and recreation complex. The research in this direction should be carried out not only at the national level, but also at the regional level within the limits of the existing powers of the regional authorities. Important in this work is ensuring the compliance of regional legal norms with the provisions of state and international law; inconsistency can become a serious obstacle to the development of tourism and recreation and investment in the industry.

Along with the above-mentioned author of the dissertation, the economic component of the macroeconomic regulation of the RTRC should be economic policy - an applied strategic management tool aimed at stimulating the development of the entire infrastructure and the real economy in the region with

the improvement of the material and technical base whose development problems have a negative impact on the TRP .

Significant discrepancy of the material base of the potential of natural tourism resources of the region to the tourism standards used in world practice is a serious obstacle to the growth of tourist flows to the region. In this regard, in our opinion, it is necessary to put into operation new tourist and recreational facilities and the reconstruction of existing ones. This mainly concerns the updating and expansion of the hotel base, capable of providing high, world-class standards of service. Creating a high level of transport infrastructure in the region that meets modern international requirements for the quality of transport and security, is one of the main tasks of state support for the development of TPCs. For these purposes, it is necessary to ensure high-quality and cost-permissible tourist transport services. This can be achieved both through state regulation and tariff regulation, as well as through the system of agreements between tourism and recreation enterprises of the region and public and private transport companies.

Modernization and reengineering of the RTRC technical base is an important condition for the creation of competitive tourist and recreational centers

in the region. Based on the experience of Western countries, in particular regarding the use of the principles of NUTS for conducting an economic statistical analysis of the activities of the TVB, the dissertation suggests more widespread use of new organizational and production forms based on the socio-innovative orientation of the regions. This is precisely the urgent introduction of a large-scale process of integration of resource-functional and system-universal potentials of the regions, which will ensure the adaptation of production-economic systems to threats and risks by accelerating the circulation of tourist and recreational resources, intensifying the processes of increasing the competitive advantages of the RTRC and optimizing communication links. elimination of disproportions within the economic complex, redistribution and diversification of structural and resource potential, unconditional implementation of the ' objective procedures for diagnostics, modeling, forecasting of the target directions of regional development of the sectoral structure of the tourism services market, permanent adjustment of the trajectory of development of RTRC with the subsequent filling of local and national budget revenues. However, the renovation and development of tourist and recreational infrastructure

in accordance with the requirements of world standards with the use of modern technologies in this area, requires a significant amount of capital investment and rationalization of investment. At the same time, the problem of insufficient investment resources is key in the development of TPCs. Conceptual approaches to the problems of financing the programs of development of the TVB in the region, the development of options and scenarios for its implementation, selection of the most attractive for the implementation of projects that are able to provide the greatest economic effect as one of the areas of state regulation of the tourist and recreational complex is implemented in the relevant regulatory legal acts. It should be noted that the current legislation within the framework of macroeconomic regulation in the field of tourism and recreation envisages (presented in the paper [69]) the possibility of using direct budget financing for the development and implementation of state and regional target programs for the development of TVB, as well as creating favorable conditions for attracting investment in RTRC. The measures developed are carried out on the basis of the current legislation and normative legal acts; besides that, assuming a set of appropriate measures and actions of the state, also provide an organizational and economic

mechanism for their financing. Along with the natural tourist resources and material and technical base of PTRK an important part of its functioning are labor resources. The training of highly skilled personnel for RTRC is a fundamental direction of macroeconomic development regulation.

The main task in this direction is the preparation of specialists at the regional level in the field of management of RTRC and marketing of promotion of tourist products. Thus, after analyzing the results of macroeconomic regulation of the development of the TVB (section 3), it became clear that an important direction of macroeconomic regulation of the development of the TVB in the region is the creation and application of a legislative framework capable of providing conditions for the development and functioning of various directions of the tourism business. In order to improve the regulatory process it is expedient, in our opinion, to rely mainly on economic methods, and to apply direct administrative influence methods only on exceptional events. In any case, we will certify that the structure of the executive body of the state entity in the field of tourism should optimally correspond to the scope and nature of the tasks entrusted to this body; on this basis, a model for implementing the state policy on the development of

the RTRC has been developed. Also, according to the results of the economic-statistical analysis, it is determined that the current state of official statistics does not allow obtaining reliable and complete information on the state of affairs related to the creation of tourism product industries (material and technical basis, number of employees, financial indicators of activity, financing channels); To improve, a number of areas of activity have been proposed that should contribute to improving the quality of information provision of state bodies that carry out the functions of regulating the tourism industry, representatives of the TV and the researchers involved in the study of this complex. Then, as you know, one of the conditions for the effective functioning of the regional economy is the transition to a more perfect system of organization of tourism industry management.

We emphasize that the basic function of management is not only evaluation but, as a result of the latter, economic regulation of the development of the tourist-recreational complex, which should be implemented and implemented for the use of adaptive management technologies capable of ensuring the continuity of the composition of the tourist tools in terms of efficiency and the effectiveness of conducting a regional policy

for the reproduction of TPP within any region. We believe that in order to guarantee economic security in the regions, it is necessary to integrate the potential of recreational and tourist growth into aggregate resources, reserves and opportunities of the national economy (NG). As acknowledged and confirmed by the author in the scientific work, the main obstacle to the formation of an effective tourist and recreational policy of economic regulation on the basis of the intensification of the processes of reproduction of the potential of spatial systems is the functioning of a non-operational management system of the real sector of the economy and the inadequacy of the mechanisms used. In this regard, we consider it expedient to acknowledge the urgent need for the formalization of certain regulators and levers of influence, which, in the opinion of the dissertation, can provide sufficient level of development of the reproduction process of the TPP of the regions of Ukraine (the content of the functional is substantiated in previous research papers by the author of the study [360, 371]) The result of the implementation of a specific function of economic regulation of the development of TPC as a derivative potential from the strategic potential of the regional economy of Ukraine as a whole - TPP, which is formed taking into account the scale of development

of the potential of sustainable development of regions. In the opinion of the dissertation, it is expedient to introduce into the theory of the development of productive forces and the regional economy the complication of defining the definition of tourist and recreational potential (TPP) by introducing into its structure the potential of transformation and reengineering for the restoration of technological, innovative and informational and methodological potentials that are extremely relevant for economic regulation of reproductive processes of sustainable development of RTRK. The aforesaid causes the necessity of developing the appropriate composition of submechanisms of the economic reproduction of development by certain groups of TPP at the regional level, conducted on the basis of separate characteristics on the basis of identification of the reproductive processes of the TPC of the regions. To make this possible:

- 1) imbalance and unity of reproductive processes in the regions;
- 2) implementation of the economic regulation of the RTRC;
- 3) calculation of parameters for assessing the quality of tourist services taking into account structural and dynamic characteristics and their normalized values

for the purpose of generating transformational changes within the economic space of the state in accordance with the determined targets for the development of the territorial recreational system of the regions.

Therefore, the author considers it expedient to define priorities in the directions of the process of reproduction of tourism and recreational potential, and the constitutively-key provisions of the implementation of redistribution and combination processes are set out in the content of the concept of reengineering tourist-recreational potential on the basis of the implementation of the technology of economic regulation of the regional economic complex.

Since any complex economic system, including regional socioeconomic systems, must and, accordingly, have to change its structural and dynamic parameters of development in time through the achievement of formal / informal trade-offs between industries, regions and diverse factors of influence on its the internal environment on the part of the state, the achievement of the effectiveness of its functioning is possible only if the basic provisions of the system, program-target, process and synergetic approaches are combined with the distinction as effective mechanisms for the implementation of regional tourism and

recreational policies to reconcile the interests of all hierarchical levels of government.

In a way, summing up the above, we will show that based on the results of the theoretical and conceptual development, the dominant, functional and institutional provisions of the concept of reengineering of TRP are determined and grounded on the basis of the implementation of the technology of economic regulation of the RTRK activity, which is based on the use of the basic principles of systemic, synergistic, process and program-target approaches to the processes of forming, building up and development of tourist and recreational potential of regions, the combination of which ensures formalization selection of effective checks and controls to achieve the reliability of RTRK in terms of resource constraints by sealing the interaction between base, and providing related industries. In addition to the above, it should be noted that, depending on the development of regional TVCs, different strategies of tourist and recreational development are offered, which achieves the implementation of the author's concept of reengineering. From this we will confirm: in the paper, it has been proved that the macroeconomic formulation in the form of RTRK should become a multi-level dynamic system of social relations,

institutions and organizations, the basis for the development of human capital, tourism, innovation culture, education and science, and the appropriate way of improving the population, which will ensure the efforts on the structural rearrangement of various tourist and recreational spheres to ensure the efficiency of the recovery process of TPP. In this way, we recognize that the economic regulation of the development of RTRK has been identified as a key resource and functional component of strategic management, taking into account the process technology of which the formation and implementation of an effective Strategy for the development of RTRK is carried out. And his applied instrument, aimed at different processes in nature, is represented:

- a) specific functions of sustainable development and human capital development;
- b) system-forming regulators of managerial, financial-economic, material-technical, social, information-communication, and cultural-historical support;
- c) system-universal levers of corrective influence on the phase path of development of the regional socio-economic system as a whole.

SECTION 2

METHODOLOGICAL BASES OF ECONOMIC REGULATION OF DEVELOPMENT OF RECREATION AND TOURISM OF UKRAINE

2.1. Scientific - methodical discourse influence of tourism on personal development of a human being

Recreational and tourism sector is an important part of the national economy in an increasing number of countries of the world, its production and investment in the world market of tourist services are increasing. Economic activity of recreational and tourist enterprises is influenced by a complex of internal and external factors of financial support. Among the most effective are the following: the form of ownership and organizational and legal forms of activities of enterprises, the actual size of providing recreational and tourist services, financial status, the theoretical and practical possibility of attracting additional financial capital from different sources, strategic goals and current tasks of functioning over a certain period of time , financial policy of the enterprise, level of management, etc. Therefore, the following data are important for assessing the financial condition of recreational and tourist enterprises: the structure of

service costs; the volume of financial results; the volume and structure of financial capital and sources of financial support; structure of accounts receivable and accounts payable; indicators of financial flows. In 2000, Ukraine joined the Millennium Declaration, which identified seven Millennium Development Goals (MDGs):. : Overcoming poverty, ensuring quality education throughout life, ensuring gender equality, reducing child mortality, improving maternal health, restricting the spread and reduction of HIV infection, AIDS and tuberculosis, and sustainable development of the environment. Among them, four goals were directly related to the recreation and tourism sectors set by Ukraine by 2015. In fact, this sphere can contribute to reducing infant mortality, improving maternal health and sustainable development of the environment. In addition, under condition of effective and accentuated social orientation, it can also affect both the elimination of poverty and the limitation of the proliferation and reduction of threatening diseases. The sphere of sanatorium-resort health improvement, recreation and tourism of the population contributes to improving the quality of his life and in general human development [27, p. 26]. As a result of national consultations, wide public discussions and taking into account the expert

opinion of domestic scientists in Ukraine, a national analytical report "Ukraine after 2015: the future we strive for" was developed. It identifies the most significant priorities for development after 2015, namely: - Equality of opportunity and social justice: the development of a just socially integrated society, where exclusion and marginalization are impossible; - effective and honest power: a prerequisite for achieving the identified development goals for the post-2015 period ; - effective health care: increasing the length of a healthy life; - decent work: promoting human development and realization of human potential; - modern economics: formation of an innovative model of development; -health environment: preservation and development of the ecological potential of the territory; - accessible and high-quality education: spiritual development and competitiveness in the labor market; - developed infrastructure: overcoming territorial inequality [28, p.117]. Among the new 17 targets identified in September 2015, the recreation and tourism sector can directly contribute to nine goals: good health and well-being, clean water and sanitation, poverty and hunger reduction, decent work and economic growth, innovative infrastructure , sustainable cities and towns, responsible consumption and production, the

fight against climate change, the conservation of marine ecosystems and land ecosystems [32, p.51 Under the influence of scientific and technological progress, there is a gradual increase in the free time of the population as It can and should be used for personal development (Fig. 1.3). In particular, the cognitive effect is manifested through the development of personality on the basis of acquaintance with historical, ethnographic, natural monuments and traditions. This function is fundamental to human development and society as a whole. Under the aesthetic effect of recreation and tourism is understood the opportunity to admire the beauty of nature, works of architects, sculptors, artists.

Fig. 1.3. Personality development of a person under the influence of recreation and tourism (generalized by the author on the basis of [26, pp. 48])

Aesthetic personality development is closely connected with the influence on its emotional and psychological state, since it allows to relieve stress and fatigue after hard work, to receive positive emotions from meetings with people, impressions from interesting tourist objects or to overcome obstacles in sports or active tourist travels The stimulating effect is realized in the fact that

participants of tourist trips go beyond the stereotyped existence, distracted from everyday things, concentrate on solving new problems. For thousands of years of organized travels, an enormous amount of manifestations of creativity has accumulated, first of all, scientific discoveries, artistic, documentary and popular science pieces; the invention of special equipment, clothing, footwear, vehicles, foodstuffs for various types of tourism; new tools and methods for training participants in active and sporting travel. Some foreign specialists and researchers point out the impact of recreation and tourism as a holistic, according to which this sphere is a means of enjoyment, creating a holiday atmosphere among ordinary life, and behavioral, when recreation and tourism are treated as a sphere of satisfaction of certain human needs. Socio-cultural influence is manifested both in relation to tourists and recreation, as well as the population of the territories receiving them. Interest in the history and culture of the locality causes the local population to know their own historical roots, the culture of their people. The curiosity that tourists and recreators show in the cultural heritage of the country, causes residents a sense of pride, a desire to preserve their national traditions and crafts. In addition, there is a purely

pragmatic need to cook excursion materials, to maintain monuments in a proper condition, which contributes to the preservation of cultural and historical heritage.

The educational context, which includes acquaintance with the history, nature and culture of other countries or regions, is also unconditional, and extends the human outlook, deepens its aesthetic perception of artistic and natural values. Tourism and recreation play a special role in bringing up the younger generation. Interesting routes, meaningful excursion program contributes to the formation of the child's worldview, his moral qualities. For example, in Japan, all schoolchildren are organized to travel their country, which not only enriches their knowledge, but also brings up love for the Motherland.

The social and communicative impact of tourism and recreation is defined as the opportunity for participants of travel or health to communicate with each other in an informal environment without production subordination, taking into account social status, age, nationality, citizenship and other features that distinguish people. Impressions from a particular trip are most often related to communication with new people. This function also manifests itself at the international level.

Recreation and tourism contribute to the mutual recognition of nations, the establishment of cultural and economic ties between peoples and, as a consequence, the development of cooperation between states, and the improvement of the international situation in general. An indicator of the expected life expectancy is an important social result of the functioning of both the whole national economy and the sphere of recreation and tourism.

Currently, the average life expectancy at birth (71.0 years), Ukraine ranks 113th, yielding to all states with a very high level of human development, 47 out of 55 countries - with a high level, with the exception of Russia (70.1 years) , Kazakhstan (69.4), Trinidad and Tobago (70.4), Azerbaijan (70.8), and even 12 of 37 countries - with an average level. As a result, the average life expectancy of the Ukrainian population is 9.1 years lower than in countries with very high levels of human development, 4.1 per cent is high and 1.1 years lower than the middle-income countries. The lagging behind of Europe and Central Asia is 1.3 and from the world as a whole - 0.5 years. Improving the quality and expanding the accessibility of recreational and tourist services is a trend that brings together both the public and experts. Tourism and recreation have all the necessary components of health:

communication with nature, environmental change, psychological discharges, physical activity.

Based on the assessment of the available potential, it is possible to further analyze the effectiveness of this sphere, which, on the one hand, has a social dimension and manifests itself in the restoration and development of the vital forces of man and society as a whole, on the other hand, is characterized by economic indicators of the state and development of recreation and tourism.

The combination of preconditions and factors of development of the recreational and tourist sphere includes the availability of relevant resources (potential), political, economic, legal, technological, and infrastructure environment. Distinguish the following groups of factors of its development:
– static and dynamic.

The first ones include natural geography (nature, climate, relief, underground mineral wealth) and cultural and historical factors that are unchanged. People only adapt them to recreational needs, making them more accessible for use. Demographic, socio-economic, logistical and political factors have different meanings, vary in space and time, and therefore they are considered to be dynamic;

– external and internal. External are demographic and social changes, economic and financial factors, changes in the political situation and legal regulation, the level of development of transport infrastructure, trade, etc. Internal factors act directly in the investigated sphere and associated with the organization of recreational and tourism activities [39, p. 278; 68].

Potential (potential potential, potential potential, potential) is the capabilities, available forces, stocks, means that can be used [69]. The concept of recreation and tourism potential covers all possibilities, available forces, stocks, means that can be used to meet the needs of the population in the field of recreation and tourism in order to create a social and / or economic effect.

The recreational resources or preconditions for the development of the recreational and tourist spheres are natural conditions, natural objects and any other natural resources that can be used for treatment, recreation, recreation and tourism [70, p. 104].

Thus, recreational resources - a combination of natural resources, socio-economic conditions and cultural values, which are prerequisites for meeting the recreational needs of people and the organization of the economic complex for recreational services of the

population [71, p. 138].

Recreational resources include: natural recreational and cultural-historical resources, social (recreational and tourist needs, solvent population demand) and economic (institutional and infrastructural provision) conditions and resources.

Due to sufficient natural and climatic and cultural-historical resources in Ukraine there are all prerequisites for the development of many types of recreation and tourism. Moreover, in most regions all components of recreational resources are available, which enables them to actively enter the tourist market. Natural recreational resources in Ukraine are extremely diverse and include: recreational landscapes (forest, seaside, mountains), recreational resources (mineral waters and medical mud), nature reserves (national natural and regional landscape parks, biosphere reserves, parks- monuments, garden art, etc.), the territory of historical and cultural purposes (monuments of architecture and urban planning, historical and architectural reserves, etc.) [61].

Natural recreational resources are divided into climatic, flora, fauna, landscape, mineralogical. Climatic includes: snow cover, comfortable temperatures, periods with maximum solar radiation, duration of the light part of the day, humidity, wind

speed, etc.

Flora and fauna resources are represented by honey and medicinal plants, hunting and fishing grounds, etc.; landscape -relave, mountains, forests, rivers and lakes, coastal areas and beaches, nature-protected areas and objects, etc. Ability to organize water recreation (water tourism and sports, fishing, water treatment, swimming-beach rest) depends on the quality of water, the bottom, beach strip and aesthetic properties of the environment.

The leading place among the landscape resources is forests, parks, forest parks, green areas of cities.

Recreational forests make up about 10% of all forests of the state forest fund. Phytotherapeutic resources are limited to the parameters of recreational use of forests, their water protective and protective properties, the healing influence on the human body and the favorable sanitary and hygienic background for treatment, recreation, tourism [63].

Forestry resources in Ukraine are rather uneven. Most forests are concentrated in the southwestern regions of the state. For forest and forest park areas, the main types of recreational and tourist activities are tourism and sports (hiking and skiing, equestrian sport, sports and licensing hunting, sports orienteering, etc.); phyto and climatic treatment; general recreation; collecting

berries, mushrooms, medicinal plants, etc.

Natural reserve territories and objects have a special place in the structure of landscape resources, namely: reserves and sanctuaries of various forms and areas of the heritage, national natural parks, arboretums, valuable natural objects, nature monuments and garden and park culture.

Recreational and tourist activities in such places are allowed only to the extent that guarantees the preservation of these valuable natural complexes.

Reserves and national natural parks create, with the purpose of preservation, reproduction and effective use of natural complexes and objects that have a special nature conservation, recreational, historical, cultural, scientific, educational and aesthetic value [72, 73].

In Ukraine, the number of nature reserves and natural parks and their area has increased in recent years, in particular in 2017 compared to 1990 - respectively, at 3.38 and 4.15 times (Table 2.1). As part of nature-recreational resources is important due to therapeutic properties, have mineralogical resources such as mineral water and mud. The first are represented by natural waters with therapeutic properties that are determined by the basic ionic-salt composition or high content of biologically active elements and gases,

radioactive substances, and high temperatures.

Mineral waters of Ukraine include the main balneological groups, namely:

A - water without specific components and properties, the therapeutic effect of which is due to the main ionic composition and general mineralization. They are used at the resorts of Mirgorod (Poltava region), Kulyalnik (Odessa), Truskavets (Lviv), Feodosia (Crimea), Ochakov (Nikolaev region) and others.

B - carbon dioxide, the medicinal properties of which are associated with the presence in large quantities of dissolved carbon dioxide, as well as ionic composition and general mineralization. Used on resorts Polyana (Transcarpathian region), Holubin in the sanatorium "Flower of the valley", Soi - in the sanatorium "Verkhovyna".

B - sulfide waters, the physiological and therapeutic effects of which are due to the presence of sulfides (free hydrogen sulfide and hydrosulphide ion). Used on the resorts of Lubenie Veliky (Lviv region), Sintsia (Zakarpatska), Cherche (Ivano-Frankivsk region).

G - glandular, arsenic or arsenic waters with a high content of manganese, copper, aluminum. The therapeutic effect is determined (in addition to their ionic, gas composition and mineralization) by one or more of the named pharmacological active

components. Used in sanatorium "Mountain Tisa" (Transcarpathian region).

G - bromine, iodine and high content of organic substances of water used in the resorts of Truskavets (Lviv oblast), Berezivsky mineral waters (Kharkiv region).

D - radon (radioactive) water used in the resort Khmilnyk (Vinnytsia region) [75, p. 389-390].

Consequently, the largest number of mineral water sources is concentrated in the western part of Ukraine, in particular the Transcarpathian region, as well as Luhansk, Dnipropetrovsk, Poltava, Rivne, Ivano-Frankivsk, Kharkiv, Zhytomyr, Vinnytsia, Khmelnytsky, Kyiv, Cherkassy, Donetsk and Zaporizhzhia regions. Private sources became the basis for the formation of such famous resorts as Khmilnik, Truskavets, Morshin, Nemyriv [62].

The second component of mineral resources - healing mud, whose deposits are reservoirs, swamps (or their areas), mud hills. They can be used for therapeutic purposes in sanatoriums, prophylactics, located near the fields, to be sent to other medical institutions, to import. In Ukraine there are quite significant reserves of medical mud, which are concentrated mainly in the southern and southwestern regions. On the basis of mud deposits there are the oldest mud mud resorts in

Ukraine - Berdyansk, Yevpatoria, Kuyalnik, Saki, Hadzhybey and others. In the northwest regions, peat muds are common, which are used in the resorts Mirgorod, Morshin, Nemyriv, Cherche and others like that.

In general, the area of developed and potential recreational territories in Ukraine (without radiation contamination) is 12.8% (in 2014) of its territory and is distributed according to the natural features of the recreational regions itself: Carpathian, Transnistrian, Dniprovsky, Donets'k-Pryazovsky, Polis'kyj, and Prychornomorsky. In determining these regions, the following factors were taken into account: geopolitical position (location of the territory, availability of labor resources, transport communications, sources of raw materials, energy, history of territory development, traditions, etc.), availability of recreational resources, the state of tourism infrastructure, demand for recreation and tourism, recreational and tourist policy of the region [62].

Usually recreational resources are considered cultural-historical, including: historical, archaeological, architectural, ethnographic objects and cultural institutions (historical, archaeological, architectural monuments, works of monumental art, ethnographic heritage, folklore, centers of applied arts and crafts ,

museums, exhibitions, theaters, etc.). Their defining characteristics are value, attractiveness, cognitive potential. Significant interest in the development of domestic and international tourism are historical and architectural monuments of Kiev, Chernigov, Lviv, Odessa, Kherson and other cities.

Thus, Ukraine has a powerful potential (natural and historical and cultural) for the development of recreational and tourist spheres. At the same time, the development of the national tourism and recreation industry is influenced by a significant combination of factors of the environment: political, economic, legal, infrastructural, etc., reflecting the characteristic features of the country's social organization, which have been historically formed.

Important prerequisites for the development of recreation and tourism are the needs of the population, defined as its social characteristics (mental, cultural, national peculiarities), as well as economic capacity to incur the costs of the corresponding services . - the price and transport accessibility of the offered tourist services;

- comfort of travel and quality of service.

Economic preconditions are the development of entrepreneurship, the availability of labor resources, capital, a favorable environment for the development

of economic activity, and so on. The conditions of the development of the national tourist market are the level of the national economic complex (especially adjacent branches of tourism), which creates opportunities for the formation of the corresponding tourist infrastructure (a network of various types of accommodation of different levels of comfort - hotels, motels, tourist bases, etc., engineering infrastructure). The most important prerequisite for the effective development of the recreation and tourism sector is the availability of recreational and tourist infrastructure: hotels, motels, rest homes, boarding houses, sanatoriums, catering establishments, transport facilities, entertaining establishments, amusement rides, etc. It is worth mentioning that at the beginning of 2015 in Ukraine there were 1258 hospitality enterprises with a total of 100.67 thousand seats. In the form of ownership, they are distributed as follows: 40% are in state and communal ownership, 57 in the collective and 3% in private. Recreational opportunities in Ukraine are also ensured by the availability of 3,304 sanatorium and health facilities of different departmental subordination and forms of ownership, including: sanatoria - 487, sanatorium-preventorium - 357, bases and other recreation facilities - 2 015, recreation centers - 235, houses rest -

38, boarding houses with treatment - 68, other institutions - 104 [74].

Infrastructural preconditions are extremely important for the development of recreation and tourism: transport security, adequate level of social infrastructure and material production, which promotes recreation and tourism activity in the region, economic and geographical situation, the nature of resettlement in recreational zones, etc.

In its function, the infrastructure of the recreational and tourist spheres is divided into productive (transport, communication, construction industry, water, energy) and social (trade enterprises, catering, consumer services, culture, children's and medical institutions). An important condition for the formation of the national market for tourist services and its interaction at the regional and world levels is the developed transport component with the corresponding traffic intensity, economic and formal accessibility [79].

Unfortunately, the state of transport infrastructure in Ukraine is extremely unsatisfactory, it requires significant investments for its formation in accordance with accepted world standards. Our state should develop a network of highways and railways, airports, sea and river ports. Aviation, automobile, railway and

river transport should provide transportation of tourists taking into account world conditions and quality of service [58]. The problem of water supply and sanitation of settlements, especially tourist centers and recreation zones, is not lost.

For infrastructural arrangement of the territory of Ukraine, significant investments are required in its development, including by central and local authorities, attracting foreign and Ukrainian investors at the state, regional and community level.

Consequently, the development of the national tourism market depends on a set of objective conditions and factors contributing to the formation and functioning of the domestic tourism industry as an interbranch complex to create a product tour. The latter must meet the specific needs of the population in terms of leisure, travel through the production and sale of goods and services of tourist destination. The development of the tourism industry should take place in accordance with the national tourism policy, the purpose of which is to coordinate business and state efforts to strengthen the country's position in the world tourism process, world economic socio-economic and socio-cultural systems. In our country, all the preconditions for the development of the tourist industry have been formed, and its tourist potential is not currently used to the full

extent, because tourism accounts for only 1.5-2.5% of GDP. The main stimulating factors in this context are mainly infrastructure changes.

At the same time there is a clear outgoing trend of domestic tourism: the number of citizens traveling abroad for the purpose of tourism is growing rapidly, while the number of those entering the country and domestic tourists is decreasing. Unfortunately, direct foreign investments in the development of resort and tourist infrastructure (Figure 2.1), the number of domestic tourists and tourists, as well as foreign citizens who visited Ukraine for the purpose of tourism, are also decreasing. A sharp decline in the living standards of the population in 2014-2015 is likely to hold back these trends, reduce the outflow of resources, but it is unlikely to contribute to the growth of domestic flows of holidaymakers.

That is why we need fundamentally new solutions to increase the use of existing potential, create new tourist products, compete in Ukraine and abroad, support small and medium-sized businesses in the tourism sector, improve the quality and accessibility of recreational and tourist services.

Implementation of system measures will, according to our estimates, increase the number of tourists in 2025 to 6 million, that is, 3.2 times, including 1 million

foreigners (2.9 times).

Increasing the volume of domestic tourism, including social, will ensure the accommodation of accommodation establishments and the realization of accumulated tourism potential. By 2025, the level of budget spending on tourism will be 0.3% of GDP (see Figure 2.1) [39, p. 283]. In general, the recreation and tourism sector of Ukraine is developing dynamically, the number of tourists and tourists increases, as well as the amount of cash receipts from tourist services (Table 2.2).

Unfortunately, direct foreign investments in the development of resort and tourist infrastructure (Figure 2.1), the number of domestic tourists and tourists, as well as foreign citizens who visited Ukraine for the purpose of tourism, are also decreasing. A sharp decline in the living standards of the population in 2014-2015 is likely to hold back these trends, reduce the outflow of resources, but it is unlikely to contribute to the growth of domestic flows of holidaymakers.

That is why we need fundamentally new solutions to increase the use of existing potential, create new tourist products, compete in Ukraine and abroad, support small and medium-sized businesses in the

tourism sector, improve the quality and accessibility of recreational and tourist services.

Implementation of system measures will, according to our estimates, increase the number of tourists in 2025 to 6 million, that is, 3.2 times, including 1 million foreigners (2.9 times).

Increasing the volume of domestic tourism, including social, will ensure the accommodation of accommodation establishments and the realization of accumulated tourism potential. By 2025, the level of budget spending on tourism will be 0.3% of GDP (see Figure 2.1) [39, p. 283]. In general, the recreation and tourism sector of Ukraine is developing dynamically, the number of tourists and tourists increases, as well as the amount of cash receipts from tourist services (Table 2.2).

Key indicators of tourism development in Ukraine, 2009-2016 years. *

Indicator	2009	2010	2011	2012	2013	2014	2015	2016

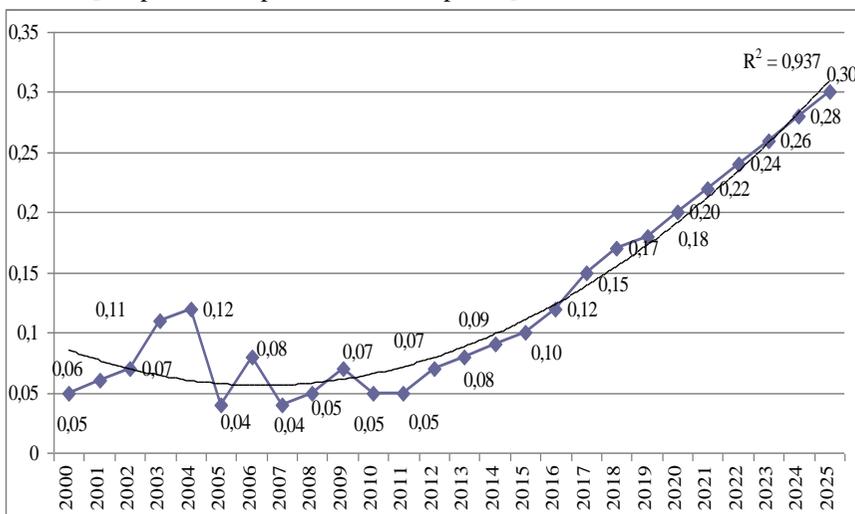

Fig. 2.1. Share of foreign exchange earnings from tourism, 2000-2025,% of GDP

(calculated by the author according to the State Statistics Committee of Ukraine)

As the experience of many European countries with significant revenues from international tourism shows, it is advisable to create tourist offices abroad to promote national tourist products.

In recent years, there have been profound positive changes in the tourism sector: new routes are being developed, hotel infrastructure is developing, tourist services are increasing, tourist attractions are improving, tourist and recreational opportunities in Ukraine are of great interest to representatives of the international tourism industry [82]. The aforesaid has a significant impact on the dynamic growth of tourist flows and revenues from tourism activities.

However, the development of tourism in Ukraine is hampered by a number of reasons: the lack of an integrated system of state tourism management in the regions; insufficient methodological, organizational, informational and material support of the subjects of entrepreneurship of the tourist sphere by the state; mismatch of most tourist institutions to international standards; unsatisfactory state of tourism, service and information infrastructure in the areas of highways and international transport corridors; insufficient

provision of tourism industry by highly skilled specialists; the imperfection of the database regarding tourism objects.

As part of the implementation of the State Tourism Development Program, certain issues were resolved. In order to improve the situation in the tourism sector, the Law of Ukraine "On Tourism", the Decree of the President of Ukraine "On Measures for the Development of Tourism and Resorts in Ukraine" was developed and adopted. These normative documents determine the main directions and prospects for the development of the tourism industry in Ukraine. At present, the domestic tourism legislation is adapting to international norms, the contractual base is being improved, about 40 international agreements on cooperation in the field of culture and tourism with leading world institutional institutions have been concluded. In Ukraine, joint international projects are being carried out at the initiative of a number of international organizations aimed at preserving the natural environment, deepening cooperation, and economic and social development of the potentially attractive tourist areas of the territories. Today, untraditional innovative approaches to the organization of tourism management in Ukraine are needed both at the state level and enterprises.

Sustainable development of the domestic tourism sector, as the competition intensifies, increasing demand for international and domestic tourism products, consumer demands for filling, diversity and quality of tourist and recreational services, requires a scientifically sound marketing strategy [83, 84].

As the economic and social efficiency of the recreation and tourism sector grows, favorable conditions for stable economic growth, creation of new jobs, provision of income and revenues to the budget will be formed. It is only possible to achieve this by constantly promoting the local product on the domestic and international tourist markets, increasing the competitive advantages of domestic producers of tourism products.

The state should encourage recreational and tourism activities in general, creating the necessary economic and political conditions, supporting its overall image of the recreational and tourist country, in particular by financing large-scale foreign and national PR events. This will promote the promotion of attractive recreational and tourism territories both in the national and international markets in the languages of intensification of globalization processes. In this regard, it is necessary to provide appropriate funds in the state and local budgets.

As you know, the development of recreation and tourism is one of the priorities of socio-economic development of the country, a significant factor of stabilization and structural adjustment of the national economy. This is stated, in particular, in the State Strategy for Regional Development for the period up to 2015 [57].

Recreational and tourism sphere can be a priority in the development of any modern state, if it possesses the necessary nature-resource potential and is able to increase investment activity, implementation of the strategic scenario of increasing the competitiveness of recreation and tourism in the domestic and international markets of relevant services.

With its tourist and recreational potential, Ukraine has every opportunity to become a world-class tourist country. Expansion of international relations opens new ways to promote the national tourist product in the international market, engaging in the global information space, best practices in organizing tourism activities [59].

The geostrategic role of our state as a connecting link between the north and south of Europe, Europe and the countries of the Caucasus is obvious. Ukraine is open to international tourism cooperation on the basis of pan-European integration processes and national

priorities. Based on national priorities, the state international tourism policy is multidirectional, implemented on the basis of economic feasibility and mutually beneficial cooperation with a particular country or region, taking into account the particularities of a particular tourism market [60]. The development of the material and technical base of the recreation and tourism sector will depend on many factors: the recreational and tourist activity of the population, the growth of its incomes, the fluctuation of prices for vouchers, the pace of economic reforms, the introduction of the Ukrainian currency and its convertibility, saturation of the commodity market, liberalization of foreign economic activity, etc. Therefore, it is extremely important to predict the processes in it for a long-term perspective. In the near future, obviously, there will be a tendency to decrease the living standard of the population. The main contingent of vacationers will be the most financially secured part of it, therefore the question remains about the state subsidies in the sanatorium and resort area. Consequently, we can state that Ukraine has a strong potential for the development of a recreational and tourist area characterized by a diverse range of natural resources, the availability of skilled personnel, material and technical infrastructure (an extensive

network of sanatorium and resort facilities, hotels, etc.). The presence of a powerful potential makes it possible to set ambitious goals for the country to accelerate the development of recreation and tourism, turning it into an important factor in human development. At the same time, significant investments are required to bring the infrastructure into line with world quality standards. Mechanisms and ways of using existing capacities in the context of realization of the set goals of development of recreation and tourism sphere are needed.

2.2. Social parameters of population coverage by recreational and tourist services in Ukraine

An analysis of the social performance of the recreation and tourism sector provides the next step after assessing the available potential for aggregating quantitative and qualitative indicators of its functioning. It is necessary to clearly assess the state and identify problems with the satisfaction and coverage of the population with health services. That is why it is necessary to estimate, firstly, quantitative and qualitative parameters of the population coverage of recreational and tourist services in Ukraine, and secondly, the socio-economic performance of the

functioning of the recreation and tourism sector. In the development of recreation and tourism, the role of outbound and inbound tourism is important, but unequal. The World Tourism Organization believes that for a balanced tourism market the following proportion is required: one inbound traveler for one outbound and four internal tourists. Countries of active tourism are considered to be those where the number of foreign tourists exceeds the number of trips of their own citizens abroad.

The tourist and recreational sphere of the national economy loses in the event of the departure of tourists abroad (foreign tourism) and vice versa: the entry of tourists from other countries (foreign tourism) and their consumption of the national tourist product is a source of growth of national income, as it increases the demand in the domestic market as for tourist services, as well as services and goods indirectly related to tourism (multiplier effect). Unfortunately, in Ukraine, the volume of outbound tourism is much higher and is not compensated by the entrance. The total number of tourists with minor fluctuations increased in our country by 2013 (Fig 2.2).

Of the 3454 thousand tourists in 2013, 2519 thousand (73%) traveled abroad, 232 (6.7%) - entered Ukraine and 703 thousand (20.3%) were domestic tourists. The

distribution of tourists by category and the purpose of visiting during 2011-2016 shows that the greatest proportion of all tourists and domestic tourists who are served by leisure and rest are respectively 99.1 and 66.8%; Business, business trips and studies are preferred by 6.2 and 22.9% of the respective contingent of tourists (see Appendix B.1-B.4). In 2014 the number of inbound tourists decreased to 17 thousand (0.7%), which is due to military events in our country. Unfortunately, the most powerful segment of the tourist flow in Ukraine is the number of citizens traveling abroad, which during 2000-2016. increased from 285 to 2519 thousand (2013) and 2085 thousand (2016). The number of foreign tourists visiting our country decreased from 378 to 232 and 17 thousand respectively. At the same time, the volume of domestic tourism also decreased from 1351 to 774 (2013) and 703 thousand (2016) [85, p. 10-11; 74, p. 467].

Such tendencies indicate that the level of development of the national tourism industry and recreation does not meet the needs and requirements of consumers to quality and world standards [39, p. 279]. The influence of such negative factors as economic and political instability, military actions, and so on remains essential.

A slightly different situation is observed with the indicators of the number of foreign citizens visiting Ukraine with different intentions, for example, for the purpose of business, business, diplomatic and private travel, ie tourism, training, employment, immigration (permanent residence) and cultural and sports exchanges. The peak of these trips is during the crisis periods, namely, the 2008 and 2013 years, which is also characterized by an increase in the corresponding values (Figure 2.3). This is due to the fact that it is easier to use the situation during the crisis periods (2008), social and political mess (2013), perhaps for business purposes or the cheaper services provided by Ukraine in comparison with other foreign the states. Among the Ukrainians, Austria, Belarus, Bulgaria, Czech Republic, Greece, Israel, Poland, Romania, the Russian Federation, the OAU, Turkey and Egypt (addendum B) are in greatest demand among the Ukrainians regarding the choice of places of tourist trips. Ukraine is attractive as a tourist destination for consumers from Belarus, Poland, Russia, the United States, the United Kingdom and Turkey (addendum D).

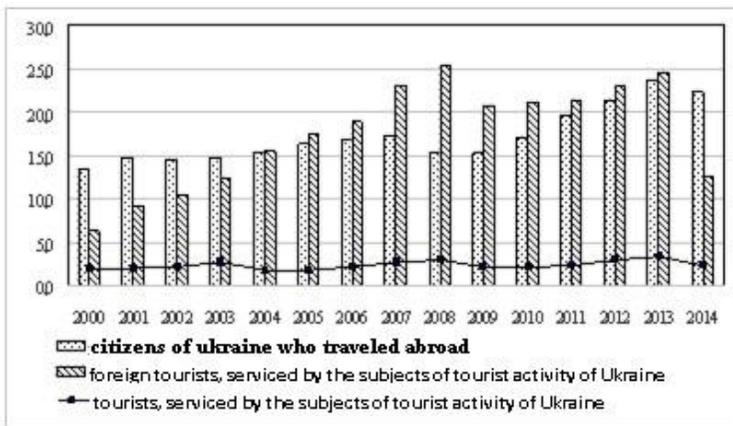

Fig. 2.3. Dynamics of migratory and tourist flows of Ukraine, 2000-2014, mln. People

Due to the low level of quality of service that does not correspond to price policy, insufficient state support for state entrepreneurship subjects, low level of development of transport and tourist infrastructure, the domestic tourism sector realizes its possibilities by only one third. Of the 1,3 thousand hotel complexes in 2014, only a small part of them complied with modern standards, 80% of hotel enterprises needed repair, rooms - reconstruction and re-equipment, technology of service - automation and computerization. One of the most important tasks is the development of a network of comfortable hotels and camps, first of all along the international transport corridors that pass through the territory of our state [86, 87]. Positive

changes took place in the sphere of hotel industry and its infrastructure. The world-renowned hotel chains (Sheraton, Hilton, Ibis, Reikartz, Ramada Worldwide, Radisson, Inter-Continental, Hyatt International, Marriott International, Accor Group, Magic Life, Rixos, Kempinski Hotels & Resorts, Fairmont Raffles Hotels International, Continent Hotels & Resort, Park Inn, Orbis, Rival Hotels, Comfort Green Hotels Holiday Inn), Ukrainian hoteliers grew up, hostel movement was activated [77]. In general, it should be noted, firstly, that there was a growth in the needs of the population in recreational and tourist services, and secondly, the reduction of opportunities for their implementation. An unfavorable demographic situation in combination with systemic socio-economic problems has led to deterioration of the health and environment of the population. The increase in the incidence rate, primarily due to diseases of the cardiovascular system, circulatory and endocrine systems, blood diseases and blood-forming organs, respiratory and digestive organs, is observed in most regions of Ukraine. In 2014, there were 62.8 thousand cases of illness per 100 thousand population, which is by 4.2% more than in 2000, and by 11% more than in 1995, including children under the age of 14 - 130,300 cases of diseases, adolescents aged 15-17

years - 118,7 thousand [88, p. 21]. Tuberculosis, AIDS, drug addiction, sexually transmitted diseases have been threatened among young people; the number of those engaged in physical culture, sports and tourism has decreased. It actualises the search for ways to solve medical and social problems of human health, which is a major factor in the organization of recreational and tourist activities, harmonized with the needs of potential tourists and tourists, as well as with the state of the environment. The social performance of the functioning of the recreation and tourism sector can be characterized by analyzing the accessibility and coverage of health services of certain categories of people, namely: children, children with special needs, victims of the Chernobyl accident, and ATO participants.

In Ukraine, the Law "On Health and Rest of Children" is in force, which regulates the provision of health-improving services (children are healed for at least 21 days or rest for at least 14 days in in-patient health and recreation facilities). The organization of recreation and rehabilitation of children is carried out at the expense of state and local budgets, funds of enterprises, institutions and organizations, extrabudgetary proceeds, voluntary contributions of legal entities and individuals, and the funds of parents.

For budget funds at all levels, less than 5% of children are being rehabilitated, with strictly defined preferential categories: orphans and parents deprived of parental care (one hundred percent should be healed by law), children from low-income and large families and talented children. The latter categories are provided by budget rehabilitation on the residual principle [89]. According to the Ministry of Social Policy of Ukraine for 2013-2015, the amount of used budget funds decreased from 634.8 to 527.3 million hryvnias, including strengthening the material and technical base of institutions (from 9.4 to 4.5% of the total the amount of used budget funds), and for the improvement of recreation and rest of the children increased (from 88.4 to 92.8%). In 2015 only regional budget and budget funds of Kyiv (49.3%) and budgets of cities and rayons of oblast importance (50.7%) were allocated for the preparation and implementation of children's recreation and recreation, including, respectively, the strengthening of the material and technical base of institutions - 1,7 and 1,9%, for recreation and recreation of children - 95,7 and 90,1%. The funds of the Social Insurance Fund for temporary disability were allocated only in 2013-2014 for health improvement - 360.8 and 325.4, having reduced by 9.8%; for rest - 0.1 and 0.9 million UAH, having

increased by 7.7 times. Other funds attracted (funds of trade unions, parents, enterprises, institutions, organizations, sponsors' funds) in 2016, compared with 2014, decreased for health improvement by 19.3%, for recreation - 0.3% (add.1) [90, p. 52; 93, p. 52; 94, p. 53]. In the summer of 2010 1718.1 thousand children of school age or 38.8% of their total number were rehabilitated, including 1336.6 thousand (77.8%) in children's health camps, 583 in sanatorium and resort institutions , 2 thousand (22,2%) [91, p. 5, 15]. In the summer of 2012 - respectively 1825.0 thousand children (43.0%), 1455.5 (79.7), 369.5 thousand (20.3%) (Table 2.3, Appendix E.2) [92, p. 7, 21]. In 2014, more than 2532.4 thousand children (58.9% of the total number of school-age children) are provided with health improvement and rest, which is by 795.2 thousand less than in 2013, of which 888.6 thousand were recovered children (20.7%), or 533.6 thousand less than in 2012. In the summer of 2014, 17.7 thousand children's recreation and leisure establishments operated (by 2.3% more compared to 2012 and 2.3 times since 2005), including 3.9% out-of-town (507 - recreation, 178 - rest) and 90,2% with a day stay (16013 units). Since 2014, indicators of coverage for health and recreation as a whole of all children and children of

privileged categories have deteriorated significantly. Summer of 2015 there were 9743 children's recreation and recreation facilities, which, unfortunately, was 30,3% less than in the previous year and by 46,5% - compared with 2013. The number of health-giving children decreased accordingly to 917 thousand by 30.2 and 53.7%. The share of well-off children (excluding those who arrived for recovery from Ukraine to other countries) in the total number of children aged 7-16 years in 2010 was 38.8 and in 2015 - 23.7% (see Table 2.3) [93, p. 7, 21].

Regarding some privileged categories of children provided with rehabilitation and rest, in the period 2010-2015. Population recovered from large and poor families decreased from 320.3 to 169.3 thousand .; children affected by the

Chernobyl disaster - from 79.3 to 23.2; orphans and children without parental care - from 67.6 to 37.8; disabled children - from 22.7 to 13,5tys. (Fig. 2.4, ext. E.3) [94, p. 7-8, 21].

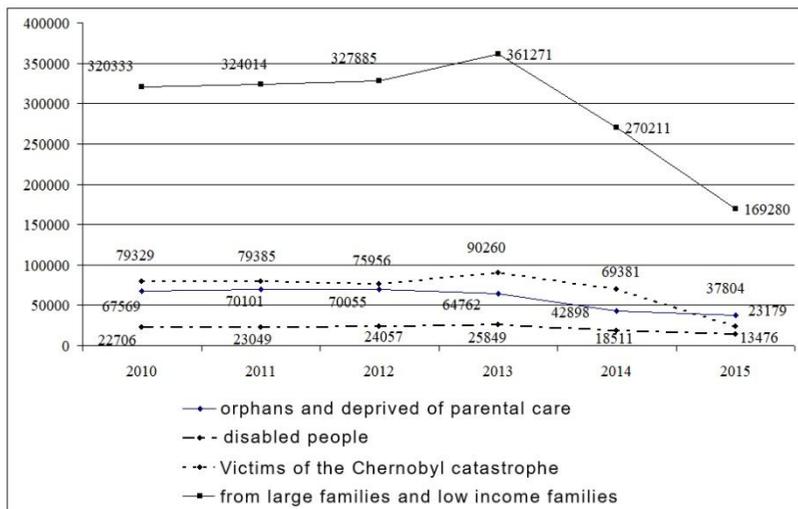

Fig. 2.4. Dynamics of recovery of certain categories of children in the summer of 2010-2015. Persons

The decrease in the number of school-age children with well-being and rest in 2014 compared to 2013 is due to the annexation of the Crimea and counter-terrorist operations, restrictions on funds allocated from local budgets for the improvement and recreation of children, and the reorganization of local structural divisions. In the summer of 2014, more than 9.3 thousand internally displaced children, children from families of victims and victims of mass protests in the mass protests during the February events on

Independence Square, children whose parents died, were injured or directly involved in the conduct of health antiterrorist operation. In connection with the temporary occupation of the territory of the ARC and the holding of the ATO, the state lost more than 122 children's recreation and recreation facilities (including the International Children's Center Artek), as well as 68 health-improving facilities and 533 recreation facilities located in Donetsk and Lugansk regions. In general, there is a slight improvement in the situation with the improvement of the privileged categories of children, namely: an increase from 2 to 4.5% of the share in all categories of health-giving children in the total number of well-off and resting children (Table 2.4).

To include vulnerable and those affected by the Chernobyl disaster. In 2014 was provided social protection of citizens, whose number exceeds 2 mln. People.

Acceleration of the development of child and adolescent rehabilitation in Ukraine impeding factors: available material base, which is under the jurisdiction of different ministries and agencies, almost never used for recreation and relaxation in the winter and off-season (a reduction in network countryside camps because of their conversion and lack of funds for repairs); poor control over the pricing of children and youth vouchers whose value exceeds the financial capacity of most young people and their parents; no flexible benefits system for travel services for children and young people, especially in ensuring their accommodation, food, transport and cultural excursions [95, 96]. Unfortunately, since 2014, expanding the range of socially vulnerable groups, which now include injured as a result of revolutionary and military action. In this regard established State Service of Ukraine for war veterans and members of anti-terrorist operation (Cabinet of Ministers of Ukraine number 326 of 08.11.2014), which is responsible for establishing the status of veteran participants ATO, providing social guarantees provided by the law, adaptation and psychological rehabilitation, provision of health-resort

treatment, technical and other means of rehabilitation, housing war veterans, social and professional adaptation.

Law of Ukraine "On State Budget of Ukraine for 2014" social protection of this category of victims provided a total 2.6 bln. USD, including rehabilitation and rest - 370.0 mln. UAH. Within the allocated funds purchased 63,752 vouchers. At the same time decreases the performance indicators in this category (tab. 2.5).

* Source, The State Statistics Service of Ukraine for the relevant years

Important indicators of social sphere oriented recreation and tourism are also general data on the number of objects of tourist infrastructure that can take people to rest and recovery. Thus, in 2016 nearly 3.9 thousand. Of tourist activities (licensed travel agencies and tour operators) provided services to 2.4 million. People, including 17 thousand. Foreigners

(0.7%) received 5,566,600,000. UAH . income from services rendered; 4572 establishments hotel and spa management services provided 5.4 million. People, including 552 thousand. Foreigners (10.2%) received 6,578,500,000. UAH revenues from services provided [97, p. 11; 85, p. 5]. In 2644 the enterprises of the hotel industry served 3.8 million. Arrivals (70.3% of visitors) in t. H. Foreigners - 527 thousand., Or 13.8% of total visitors.

Most hotels and similar accommodation facilities are concentrated in Lviv (273 units.), Odessa (235), Transcarpathian (229) Ivano-Frankivsk (212) regions, m. Kyiv (157) and Dnipropetrovsk (146 units). Region. In 1928, health-resort facilities and recreation facilities improved their health of 1.6 million people, including foreigners - 24.4 thousand., or 1.5% of the total number of people served. Most citizens improved their health in seven regions of Ukraine: Dnipropetrovsk (14.6%), Odessa (13.0), Zaporozhye (11.1), Lviv (10.6), Kherson (7.1), Nicholas (6.4) and Transcarpathia (4.9%) [97, p. 11, 52-53] .With order to perform diagnosis of generalized social impact of providing public recreation facilities tourism industry proposed integrated index by calculating its integrated indexes of logistics and traffic facilities. We identified two groups of indicators: the first - availability of infrastructure - includes data on the number of beds in hotels and other places of short-term accommodation and sanatorium establishments per 10 thousand. population; the second - up visit (the number of served / recovered persons) - number of served visitors in hotels and other places of short-term residence and recovered in a sanatorium establishments per 10 thousand. population.

After the appropriate calculations for 2000-2016 gg. Allocated to five groups of regions with approximate integral indicators index (ii) development of tourism and recreation (relatively averages roughly equal to 1.00), the highest level

(above 1.40) higher average (1,05-1,40), average (0,70-1,05); below average (0,35-0,70); the lowest level (to 0.35) (Table. 2.6, ext. ZH.1-ZH.4).

Table 2.6

Grouping regions in terms integral index (II) of recreation and tourism Ukraine for years *

Level	Region by region	Index	Level	Region by region	Index
2000-2016rr.			2000-2016 biennium.

* Source: developed by authors

An analysis of the relationship between the development of the material and technical base (Ii1)

and the attendance of objects (Ii2) of the recreational and tourist sphere of Ukraine was performed, and a significant territorial uneven distribution of objects of the tourist and recreational sphere and the effectiveness of their use during 2000-2016 was revealed. .

As a result, five groups of recreational and tourist regions are distinguished:

- with the highest level of infrastructure development and attendance of objects: Odessa and Kherson regions, where the bulk of tourist and recreational establishments of Ukraine are concentrated and which are geographically concentrated near the sea and water recreational resources, which testifies to the sufficient development of recreational and tourist activities for provision of the corresponding services in resort areas and tourist centers and infrastructural provision of coastal areas;

- higher than the average - Lviv, Mykolayiv and Sevastopol City .; average - Volyn, Transcarpathian, Zaporizhia, Dnipropetrovsk, Kyiv region and the city. kyiv;

- lower than the average - Vinnytsia, Volyn, Donetsk, Zhytomyr, Ivano-Frankivsk, Luhansk, Poltava, Rivne, Sumy, Ternopil, Kharkiv, Cherkasy, Chernihiv region, which certainly confirms the existence of significant potential Therapeutic recreation and tourism;

- the lowest - Kirovohrad, Khmelnytsky, Chernivtsi regions.

Grouping regions of Ukraine by a combined index of recreation and tourism during the 2001-2016 biennium. Found that disparity varies only in the group of the highest and lowest level due to the annexation of the Crimea and the temporary occupation of the territories of Donetsk and Lugansk regions (see. Table. 2.6).

Thus, during the 2001-2016 biennium. Significantly reduced the number of objects, especially health centers (specialized accommodation facilities) - from 3304 to 1928 (by 41.6%). And not only decrease occurred in 2016 (31.8%). This trend is inherent throughout the study period, indicating a deterioration in the health of the population. Proof of this is the reduction ratios and if 2001 10 thousand. Population was 0.7 establishments of this type, the year 2016 - only 0.4. Unfortunately, we must note that the development of recreation and tourism in Ukraine is characterized by a generally negative trends (tab. 2.7).

Table 2.7

**Indicators of social performance objects and subjects
recreation and tourism Ukraine, 2001-2016rr. ***

Indicator	2001	2005	2014	2015	2016	2016 to 2015,%
Number of objects from.: - specialized accommodation facilities	3304	3245	2377	2829	1928	68.2

Source: [98, 73, 85].

At the same time the positive trends observed increase in the number of such establishments as hotels and similar accommodation facilities for them, as well as subjects of tourism - respectively from 2682 to 3885 and from 0.6 to 0.9 establishments per 10 thousand. Population.

Also descending character with coverage indicators rehabilitation services and recreation. Yes, most reduction was served on the size / recovered in sanatoriums - from 3012 to 1610 thousand. People (46.5%), including against 2015 - by 43.2%. If in 2001 10 thousand. People improved their health in sanatoriums 622 people, the year 2016 - only 375 people.

The number of persons served hotels and business tourism, in general grew steadily until 2015, and in 2016 - declined. Overall, the number of people served in hotels increased from 3497 to 3814 thousand. (9.1%), including 10 thousand. People population - from 722 to 888. The subjects of tourism services provided in 2001 p. 2175 thousand. people, whereas in 2016. - 2 425 thousand. The number served by 10 thousand. Population respectively increased from 449 to 565 people.

Noting the generally positive trend of the operation of hotels and business tourism, it should be noted that these institutions provide services mostly for a fee. Therefore, to attribute them to the characteristics and components of the process of human development is possible only if the increase in the coverage of these services accompanied by rising personal income.

The social aspects of recreation and tourism areas, as noted above, and include employment rates, which are characterized by negative trends (see. Table. 2.7). For example, in health centers reduce the average number of full-time employees amounted to 57.9% (relative to 2015 - 41.6%); rates - 15% in 2005 (29.6% in 2015); in tourist activity - increased

from 10 632 (2005 g.) to 11 513 (2016 g.), but compared to 2015 decreased by 15%.

In the recreation and tourism is concentrated great potential medical, administrative staff, support staff employed to maintain the recreational and tourist flow. In particular, in 2016 this sector employed 89.9 thousand. People (1.0% of the total average number of full-time employees - 9 mln.), Including of tourist activities (licensed travel agencies and tour operators) - 11.5 thousand. people (12.8% of total employment in the recreation and tourism sector), hotels and similar accommodation establishments - 26.6 thousand. (29.6%), spa and wellness facilities - 51.8 thousand. (57.6%). Number of employees (10.6 mln. People) compared to 2015 decreased in all economic activities, particularly in temporary accommodation and catering - by 8.2%, the arts, sports, entertainment and recreation - the lowest at 0.3%, reaching 269.9 thousand together. people (2.8% of total) [99, p. 13]. A considerable share of employment in the tourism and recreational facilities are highly qualified, with the average number of full-time employees in the tourism sector with higher and secondary special education 6.2 thousand. People (84.5%), health resorts and health centers employed 5.2% 14.6% of doctors and nursing staff [97, p. 11, 52-53; 85, p.5]. 2% of physicians and 14.6% of nursing staff [97, p. 11, 52-53; 85, p.5]. 2% of physicians and 14.6% of nursing staff [97, p. 11, 52-53; 85, p.5]. 2% 14.6% of doctors and nursing staff [97, p. 11, 52-53; 85, p.5]. 2% of physicians and 14.6% of nursing staff [97, p. 11, 52-53; 85, p.5]. 2% of physicians and 14.6% of nursing staff [97, p. 11, 52-53; 85, p.5]. 2% 14.6% of doctors and nursing staff [97, p. 11, 52-53; 85, p.5]. 2% of physicians and 14.6% of nursing staff [97, p. 11, 52-53; 85, p.5]. 2% of physicians and 14.6% of nursing staff [97, p. 11, 52-53; 85, p.5].

Thus, at the present stage of recreation and tourism Ukraine affected a large number of negative factors, such as: unstable political and economic situation, the imperfect management mechanism, worsening socio-economic situation, the loss of much of its potential as a result of annexation and military operations and more. Based on the analysis of the current state of tourism and recreation system, taking into account macroeconomic and regional factors, the following features of their development:

- deterioration of social performance indicators functioning areas of recreation and tourism decline (especially in the last two years) level of coverage of different types of recreation and tourism;
- growing structural imbalance of the market recreation and tourism in the region, the loss of a large part of recreational and tourist potential of the area (the Crimea and Donbas);
- chronic underemployment objects recreation and tourism infrastructure and a significant depreciation of fixed assets of these companies lack the resources to improve the quality of services and investment.

In this situation, particularly actualized question of finding effective mechanisms of recreation and tourism as an important factor for economic and social development of the national economy of Ukraine. Our country has the potential for development of recreation and tourism and enhancing their impact on the social aspects of life: rest and recovery, increase intellectual capacity and cultural level of the whole person and - quality of life. However, it is important not so much the economic realization of this potential as enhance the social aspects of recreation and tourism areas, its role in sustainable human development.

2.3. Metodolohiya calculating the environmental and economic burden of tourism

The international community is increasingly concerned about the negative effect of tourism on the environment, namely degradation of natural landscapes due to excessive consumption of resources; buildings lands; pollution of natural objects; threat to wildlife and the habitats of animals and birds; loss of biodiversity and, finally, a violation of local customs and communities and so on. Urgent scientific challenge in this area is the calculation of thresholds degradation of recreation areas on the number of visits. It takes into consideration the quality of soils (the sandy, loamy black soil to) the type and density of forest stands (steppe vegetation, coastal) and other factors for the temperate climate, the ability to determine recovery inflicted pressures. These values are individual for each recreational area and are experimentally. INconditions rapidly growing turystopotokiv that in 60 years increased 40 times (from 25 mln. in 1976 to over 1 billion. persons in 2016) is growing travel burden on the world of recreational and tourist resources, which in some places increased turystopotokiv concentration has reached critical limits. Identify logistical capacity (maximum load) sea beach during summer vacation possible under sanitary norms length of beach per person (which is 0.2 meters). This is best formulas, which are listed below:

1. Pokaznyk provision coastline beaches:

$$Z_n = L_n / L_{zah},$$

where Z_n -availability of beaches (m / km);
 L_n -length beach (km)

Lzah-coastline (km).

2. Pokaznyk single maximum capacity of the beach:

$$EP = Ln / CH$$

EP-where maximum capacity single beach (pers.)

Ln-length beach (m);

CH-sanitary norms length of beach per person.

3. Pokaznyk degree of use of beach resources

$$Bn = Jer / EP$$

where Vp-degree use of beach resources (%);

Jer-capacity recreation facilities (pers.)

EP-single maximum capacity of the beach (pers.).

4. Value of maximum (allowable) annual capacity of beach:

$$Yemr EP = T \cdot$$

Where Yemr, the maximum possible (acceptable) annual capacity of the beach (pers.)

EP-single maximum capacity of the beach (pers.)

T-period with favorable climatic conditions (days).

5. Rate as possible (acceptable) turystopotoku (ie potential logistics beach):

$$PMR = Yemr / TST$$

Where the LDP - the maximum possible annual turystopotik (pers.)

-The maximum annual capacity Yemr beach (pers.)

TST - Average Duration (days).

6. Opređenje daily capacity most famous and visited tourist sites that form the cultural and historical potential of the big city, which attracts tourists (C):

$$C = (C1 + C2 + C3 + \dots) (1 - Ir)$$

where c1-capacity facility 1;

C2-capacity facility 2;

C3-capacity facility 3;

Ir - correction factor site visits by local residents and individual tourists.

To determine the daily throughput (logistic capacity) of the proposed technique developed by the author based on the algorithm recommended by the UNWTO for architectural and historical exhibition of objects:

7. Vyznachayetsya throughput capacity the facility:

$$P = Y / Y,$$

where P - the throughput capacity of the object (pers.)

T-object area (m²); Z - recommended standard density yet m² / tourist).

8. Determine the rate of rotation:

$$K_p = B / B$$

where K_p - coefficient of rotation;

M - number of hours per day when the facility is open to tourists (h.);

B Average Visit Duration (h. - min).

9. Determine the maximum allowable number of daily visitors (maximum daily flow of tourists - the logistic potential object):

$$Matthew \cdot P = K_p,$$

where Matthew - the maximum number of daily visitors (pers.)

P - throughput capacity of the object (pers.)

K_r - coefficient rotation.

As an example, the calculation of logistical capacity (ie maximum possible turys-topotoku) for tourist object-medieval castle area of 10,000 m² (t = 10000m²) and standard density rating Y = 5 m² / 1 tourist.

So, first determine carrying capacity of the object: $P = 10000/5 = 2000$ people. 10. Rozrahovuyemo rotation coefficient: $K_p = 8 \text{ hours} / 1 \text{ hour. } 40 \text{ min.} = 4.8$.

Finally we get value logistics capacity fortress that is the maximum possible amount turystopotik

**Matthew 4,8 · = 2000 = 9600
people. / Day.**

Similar results in other climates can have an effect that is different from resulting in a temperate climate. The calculated thresholds environmental degradation can be used with a known approach to any region of Ukraine, which will enable the planning and creation of recreational areas expected to limit the flow of visitors, ie power recreational facilities. In the practice of tourism enterprises most widely following indicators.

Return on sales (P_p) is calculated as the volume sold in tourist products and services and their individual categories:

$P_p = BP (PE) / VR (UR) * \underline{100\%}$ or $P_p = BP (PE) / C * 100\%$

where BP - balance profit;

PE - net profit;

In p (ap) - earnings (net revenue) from sales;

WITH - cost.

Unified methodology for determining the load on the environment there is not only in our country but also abroad. Modern authors use both terms of human pressure and throughput capacity, adequate or optimal load it [50, p.166]. The results of the analysis of methods of calculating ecological and economic burden of recreational methodological point of view it is advisable to calculate the capacity of the territory is

not in size, but based on linear load (recreational trails capacity of areas for recreation). In particular, L. Kobanets gives the formula for determining the capacity of the controlled recreation area (Ecotourism recreational area):

$$(1.1)$$

where - the best of recreation, pers. / Day;

- reclaimable factor considering violations of vegetation, soil compaction during laying and improvement of trails (from 1.5 to 2.0 for wide and narrow paths, respectively);

- the width of the trail and on-site and route of (typically 1.5-2.0 m);

- Length of segment of the route (between network nodes), m; n - number of sections of the network;

- the area that holds the j-th object display, point of rest, etc. m²; m - the number of objects the show, points of rest;

- normal distribution paths for tourists that prevents physical and psychological discomfort when passing route (depending on the curvature, the width of the path, the type of vegetation, wildlife, etc., should be determined in each case), pers. / M²;

T- the duration of the global day, hour.; t - the average length of stay in the recreational area. kWh / day [55, p. 102].

This is particularly important even distribution of tourists and travelers on the paths in the world by means of monitoring. To this end, taking a number of measures, including timely (possibly temporary) closure of congested areas and promote visits frolicking. Through management solutions can increase throughput, including by planning paths to a more widespread distribution of tourists and travelers the natural park; reducing conflicts between competing types (eg, selection of sites for special campsites, hotels and green stands for unorganized tourists); of advocacy; increase the strength of the resources are updated (for example, materials for road surface);

Thus, implementation of methodological linear approach to calculating recreational capacity of natural areas, along with the creation within the parks recreation and tourism enterprises of innovative type (year-round water park high bandwidth) and collection of rent for natural recreational resources of enterprises will contribute to the sustainable development of recreational and tourist activities natural parks, improve the economic and environmental and social conditions in the regions. Defining ekeoloho economic trends of tourism and recreation studies in the social aspect, we should pay attention to the following: -forming concept of sustainable development of recreation and tourism at different territorial levels; -vyychennya tourism and recreation as systematically organized phenomena, analysis of current trends in their development; -development and standardization comprehensive methodology for assessing the tourism potential of the territory at the national, regional and local levels; - scientific substantiation limits, models design and development of tourist-recreational special economic zones on the basis of permissible recreational loads; -development management mechanisms recreational zones on the basis of formation of the system of statistics, processing and analysis of data on tourism, development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. - scientific substantiation limits, models design and development of tourist-recreational special economic zones on the basis of permissible recreational loads; -development management mechanisms recreational zones on the basis of formation of the system of statistics, processing and analysis of data on tourism, development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and

local recreation and tourism markets on the basis of monitoring [57-64]. - scientific substantiation limits, models design and development of tourist-recreational special economic zones on the basis of permissible recreational loads; -development management mechanisms recreational zones on the basis of formation of the system of statistics, processing and analysis of data on tourism, development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-

64]. development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64].

Let us consider what happens as a result of the tourism industry. The negative effects of tourism today in a country experiencing many of the developing countries, especially those that do not have sufficient technical and financial capacity to fill the resources spent by tourists and held them remove waste. No secret that such waste in its volume Often far exceed those generated in the daily activities of the total population, which is the subject of tourism. For example, in Nepal, where large popular this kind of outdoor activities like hiking, every tourist is estimated every day burns about 6 kg of wood, and despite the fact that the country has an acute shortage of fuel. In the Egyptian capital Cairo, a stately hotel for a year consumes as much electricity how much it spends 3,600 households belonging to middle-income Egyptians. In the Caribbean region, the demand for seafood from tourists is so high that a major factor was the increased burden on the population of lobsters and shellfish. The pursuit of "natural"

building materials and often poses a particular natural resource on the brink of extinction. Many beautiful corners of the world, not excluding protected areas is significantly affected by the inflows of tourists - "nature lovers", which is fraught with disastrous consequences for biodiversity of these places. The pursuit of "natural" building materials and often poses a particular natural resource on the brink of extinction. Many beautiful corners of the world, not excluding protected areas is significantly affected by the inflows of tourists - "nature lovers", which is fraught with disastrous consequences for biodiversity of these places. The pursuit of "natural" building materials and often poses a particular natural resource on the brink of extinction. Many beautiful corners of the world, not excluding protected areas is significantly affected by the inflows of tourists - "nature lovers", which is fraught with disastrous consequences for biodiversity of these places.

Tourism, as noted above, also leads to environmental pollution, dumping of raw sewage into the waters of rivers and seas, transportation emissions include carbon dioxide and oxide of nitrogen, and the production of garbage and other solid waste (eg, committing cruises Court of tourists in Caribbean alone, each year more than 70,000 tons of waste). Construction of infrastructure and tourist destination also adversely affect the environment.

For example, 3/4 of sand dunes on the Mediterranean coast between Spain and Sicily did not actually exist mainly because their allocation and under construction, is designed to serve tourists. Whether tourists remain satisfied with the resort of time,. Since the pristine natural environment - a prerequisite for a pleasant pastime, its retention is 100% important economic factor for the tourism industry, for those policy makers in this area, experts and guides most travel companies, carried out both independently and in collaboration with private and public sectors. Shall be adopted restrictions and regulations

to prevent and minimize the damage that tourism puts biodiversity. Such inputs should include monitoring of existing actions assessment of the environmental new tourism projects.

On the 1st local residents can account for up to 130 tourists. From 1st hand, it stimulates the production of all products required for use by tourists, providing download all service areas, and on the other - can interfere with the normal life of citizens, and if market conditions change and cause seasonal surge in unemployment and worsening social tension. Tourism industry is characterized by a high degree of monopoly, which implies a concentration of services and profits in the hands of a small number of international corporations. In many of the countries most of the tourist facilities owned by foreign capital. There should be a fair balance between local actors and investors. Locals, as the main source of labor should be interested in an interesting and well-paid bot

On environmental summit in Rio de Janeiro (in 1992) Industry was presented to the World Council of Travel and Tourism (VSPT) - one of two international organizations involved in the introduction of this activity, and the topic touched only indirectly or in the context of other issues. However, the agenda for the XXI century formulated very far-sighted belief that travel and tourism industry has enormous potential, allowing it to make a constructive contribution to the sustainable development of all regions of the world. Of course, these problems can not be left unattended. Much can be done with reasonable planning and design, rational planning and rational use of possibilities - that which can be useful to sustainable development. In order to follow the basic principles of the concept of sustainable development, be measured disposition and intensity of action provided to conduct environmental inspections, to take into account the potential burden on the environment, optimize resursospozhyvannya,

invest in new technologies. It should take into account all factors, interests and obligations of stakeholders - government, industry and social circles, and the latter, of course, are themselves as tourists and local naseleynya. Ale positive factors of tourism development over problems it generates.

First, thanks to tourism and creating new jobs; work related to tourism, often highly paid, therefore, income tax revenues more people and grow.

Secondly, the state through the importation of foreign goods needed for consumption by tourists and further development of tourism can introduce customs duties on imported goods.

Third taxable services provided to tourists (hotel accommodation, meals, drinks sale, transport).

Fourth, pay taxes on both local and foreign firms that have the right (license) to engage in tourism business in the country. There is a possibility of revenue from tourism to direct financing of infrastructure development, restoration and renovation of historical and cultural monuments, the implementation of environmental programs, social development programs and more.

The concept of ecological and economic processing can be understood as a separate study of social problems (position) or stage a comprehensive study aimed at obtaining information and justification of the recommendations. The national field of recreation and tourism, it covers a range of measures, methods and assessment methods that make it possible to determine the level of social well-being, satisfaction and business users of its business.

This diagnosis should be based on interdisciplinary connections of social work, economics and other fields of scientific knowledge. Consequently, we are faced with the task ryzkyoutvoryuvalni identify factors that affect the safety of tourism, evaluate them, analyze ways to minimize and make

proposals to develop mechanisms for financing these measures. . These results can primarily be internal (position of operation areas) and external (to the entire economy) character; second - direct manifestation (the number of tourists recovered persons, the number of business entities, etc.) or indirectly - over time (improved health expectancy and quality of life, etc.).

Ecological and economic assessment is the basis for determining ways to expand the possibilities of using population of free time in order heal attitude, culture and the study and sports activity, forecasting further perspective development of recreation and tourism. Ecological and economic feature is fundamental in demography, social economy and policy.

So based on the above stated it can be concluded that the socio-economic aspect Recreation - a broader concept that includes tourism as one of the constituent types of recreational activities. On the basis of summarizing the multiplicity of definitions reasonable interpretation of the concept of recreation and tourism as a social phenomenon, on the one hand, the relationship represents about restoring the health and vitality of a man on the other - is an important part of national economy, combining extensive system of recreational and tourism facilities, infrastructure companies and other related industries, which have close economic and industrial ties, sharing resources to meet a variety of zdorovchyh, cognitive, cultural and other needs, depending on the quality of the environment and the safety of tourists.

Under the current legislation of Ukraine the subjects of tourism to ensure the safety of tourists must: inform tourists about the dangers when traveling on the implementation of mandatory requirements and precautionary or preventive measures (medical vaccinations, etc.); create safe conditions in places of tourist services, to ensure proper installation of hiking

trails, walks, tours, etc. carry out special safety requirements at time of travel services with an increased risk etc.

Those who organize tourist exploitation of resources required to ensure compliance with the requirements of environmental protection and cultural heritage, and to take measures to minimize or cease the harmful effects on the environment and socio-cultural environment and to compensate for losses incurred while. The state ensures protection of the legitimate rights and interests of foreign tourists in accordance with the law and international treaties of Ukraine and guarantees the protection of the legitimate rights and interests of citizens of Ukraine traveling abroad.

The goals of ecological and economic sphere of recreation and tourism are to accurately assess the situation and identify challenges to meet and coverage of tourism and health services. Therefore, to determine the social priorities of recreation and tourism is extremely important analysis of trends and general coverage (total and individual groups) related services, the number of businesses, employment in this sector and related industries and so on. The corresponding indicators in the matrix of social priorities the development of recreation and tourism are in tabl.2.3.

Table 2.3.

Indicators of social development priorities recreation and tourism areas *

Indicator	Direct results	Indirect results
Local results	Coverage of recreational and tourism services. Reach specific groups of recreational and tourism services. Employment in recreation and tourism activities. Rising incomes and scope of entities sphere	Improvement in health and life expectancy. Improving the quality of life. Increased cultural and patriotic standards. Implementation of a healthy lifestyle. Improved quality performance of the areas

	of recreation and tourism	of recreation and tourism (improving service quality, improving logistics infrastructure, diversification of services)
External results	The development of related industries. Employment growth in the economy. The increase in income. Increasing GDP	The acceleration of socio-economic development of cranes. Improvements in human development

2.4. Formation of informational and methodological framework for assessing the socio-economic impact of national scope recreation and tourism

Recreation and tourism is an important part of national economy in more and more countries, increasing its production volumes and investments in the global tourism market. Secretary General of World Tourism Organization (UNWTO, UNWTO) said that the tourism sector plays an increasingly

important role in promoting economic growth and international trade, so you should raise it a priority and make the most appropriate potential [100].

According to latest reports Release UNWTO Barometer international tourism, revenues tourist centers around the world made by international visitors on accommodation costs and meals, entertainment, shopping and other services and products in 2016 reached about 1.159 trillion. dollars. US, more than the previous year by 5% [101, 102]. The leaders are to attract tourists: Europe - 42% of all revenues from international tourism, Asia-Pacific - 31 and American region - 20%. Last place Middle East analysts prefer - 4% share of total income and Africa with those of 3% [101].

These results are explained by the following factors: the most significant growth in the amount of 35 billion.USD. US to provide tourist services in 2016 took place in Europe - to 489 billion. Dollars. USA. Asia Pacific increased its rates by 30 billion. To 359 billion dollars. USA. In America, growth was 16 billion. (To 229 billion. Dollars. USA), the Middle East - 47 in Africa - much less - 34 billion. Dollars. USA.

Significant positive dynamics of these regions can be explained by a professional systematic approach to the management of the tourism sector of the state scientists, economists, analysts, business elite [103, 104, 105, 106, 107]. Thus, the rapid development of tourism contribute to Asia extremely special ethnographic resources. Tourism in the United States properly funded, supported by special government programs. This area of activity is recognized in the United States' second major employer after the health care, the third sector to attract foreign currency after agriculture and chemical industry "[108, p. 57].

Analysis of the contribution scope recreation and tourism development of the Ukrainian economy should be based on the position of its significant natural, historical and

ethnographic potential. Only resort and recreational areas occupy almost 13% of the state [109, p. 211-217].

By using a matrix of social sphere diagnosis recreation and tourism may diagnose it in value terms. This should analyze the dynamics of incomes Ukraine using statistical information. During the 2010-2016 biennium. Been a slight increase in the real income of the population, with the highest rates, ie 117.1% in 2010 compared with 2009. However, in the previous period there was a decline in this indicator. Rising incomes empowers travel and recreation and health (tab. 2.8).

Table 2.8

The dynamics of household income and the number of citizens of Ukraine who went abroad 2010-2016 years. *

Year	Dynamics of incomes		The number of citizens who traveled abroad	
	bln. UAH.	percent from the previous year	thousand. people	percent from the previous year
2010	128.7	-	13422	-
2011	381.4	296.3	16454	122.6
2012	1101.2	288.7	17180	104.4
2013	1266.8	115.0	19773	115.1
2014	1457.9	115.1	21433	108.4
2015	1548.7	106.2	23761	110.9
2016	1531.1	98.9	22438	94.4

* Source: [74].

Proved dependence of the number of tourists visiting the income level of the population of Ukraine as a polynomial of the second degree and exponential function (Fig. 2.5).

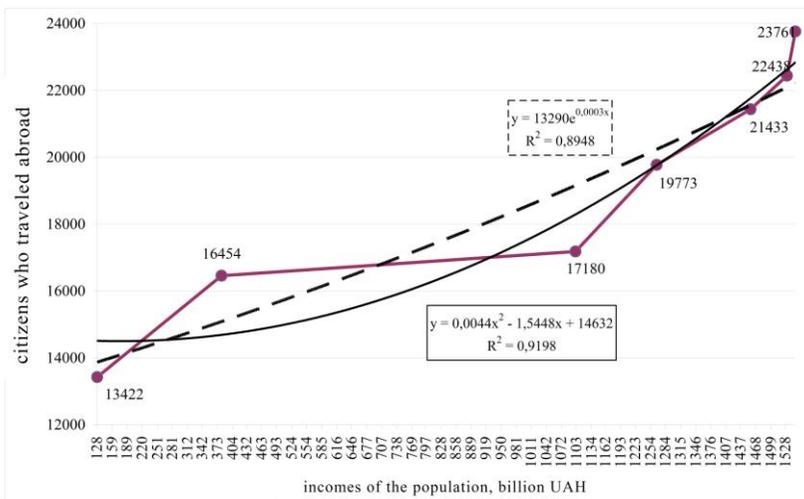

Fig. 2.5. The dependence of the number of tourists visiting-income Ukraine

Regardless of the method depends presentation, there is a high level of distress communications (91.9 or 89.4%), confirming the dependence of recreation and tourism areas of effective demand and, consequently, its level of income. Therefore, to ensure the welfare of the population is essential for accelerating human development.

important macroeconomic indicator is the gross domestic product (GDP), measured as the difference between output at market prices and intermediate consumption at purchasers prices, or the sum of gross value added economic activities and taxes on products except subsidies on them. Since 2010, GDP calculations carried out by economic activity (NACE 2010) [74].

During 2010-2016rr. GDP (USD) per capita (PPP) was as follows: 2010 - 1828.7 UAH.; 2012 - 2974.0; 2013 - 3570.8; 2014 - 3856.8; 2015- 4030.3; 2016. - 3014.6 UAH. [110].

Construct regression and stochastic schedule depending on the number of tourists visiting the level of GDP per capita (rys.2.6).

Circulation data on the distribution line regression is picking its algebraic expression that provides the maximum value of the index . Get regression equation smooths trend changes coefficient of multiple determination () Equal to 0.898 or 0.888.

Thus the observed dependence of the number of tourists visiting the level of GDP per capita Ukraine in a stepwise and exponential functions with high levels of distress communications (89.8% or 88.8%), which proves the expediency of enforcing the social sphere diagnosis and recreation and tourism the need to ensure the growth of GDP per capita.

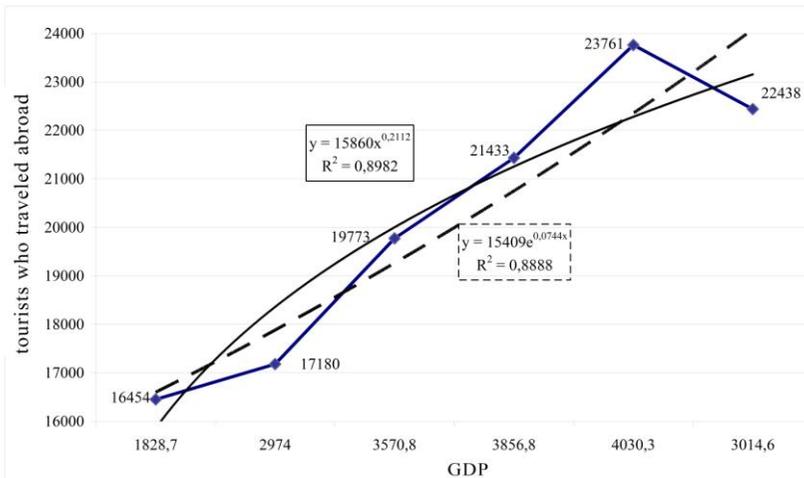

Fig. 2.6. The dependence of the number of tourists visiting the level of GDP per capita

Expanding the population of Ukraine travel and recovery associated with higher levels of household income and

economic stability due to the growth of GDP. Because the latter gradually increase the proportion of citizens who can afford a comfortable rest and recuperation and thus are the target segment for operators of tourist services.

Contribution to GDP carried out economic activities of tourism and recreation, the volume of which depend on complex factors. Among them, we selected two quantitative indicators: number of hotels and similar accommodation and resorts with treatment.

king-size income from tourism in the regions of Ukraine for 2016 falls on city Kyiv, Dnipropetrovsk and Kharkiv regions. As we study the hypothesis put forward the claim that the income of tourist activity in regions stochastically depend on the number of hotels and similar accommodation and health centers with medical treatment [111].

Using stochastic models describing patterns associated with simultaneous exposure to the object of many factors that can be clearly identified only in mass observations. The most common method of building such models are - multivariate statistical analysis, including correlation and regression. As practice shows, are formed in this way stochastic models have the advantage in the quantitative description of causal relations in economy and social sphere in comparison with deterministic models. Better understand the nature of the phenomenon can be achieved by identifying quantitative ratios that look like regression. In turn, this allows us to influence the identified factors intervene in the economic process to get the expected results.

According to the classical regression analysis of economic processes described by one is not functional and stochastic regression equation. There each set of explanatory variables, with only essential, can meet multiple values explicable variable. Uncontrolled or unmeasured factors and measurement errors included in the random term (deviation). It

is assumed that the explanatory variables are not random and not correlated, and the random component has a diagonal variance-covariance matrix with equal diagonal elements (variances) [112, c.10].

For graphical and analytical representation depending incomes of tourist activity in the regions on the number of hotels and similar accommodation on the number of health centers with modern medical treatment used software packages such as Microsoft Office, which provides a significant acceleration of labor-intensive analytic transformation . One of these programs, which may simulate stochastic dependence is a spreadsheet Microsoft Excel.

The degree of approximation of the mathematical representation of patterns of change in the index under the influence of selected factors reflecting coefficient of multiple determination [113, p. 120]:

(2.1)

where - the actual value of the i-th target;
- the average rate for the period studied;
- deviation of actual terms of the estimated
zahladzhuvanoyi point line.

With this formula it follows that if Then, that when the sample values fall in the line of regression, the coefficient of multiple determination takes the value 1. The lower rejection valuation data and the regression line, the greater the coefficient of multiple determination unit close to [113, p . 120].

Studies have shown that the description of economic processes using a single regression equation is not enough because of the many interrelated causes and effects. Therefore, to properly reflect the real relationship in economic processes appropriate to use a system of regression equations. The estimated value of a random member of the regression in many cases (especially when analyzing time series) reject the basic

assumptions of the classical regression analysis, as evidenced by reasonable tests to test hypotheses about the appearance variance-covariance matrix of random deviation. The idea of the relationship between economic variables and assumptions about the overall look of this matrix have led to a new type of stochastic models - econometric [112, c. 10].

Econometric model is a logical (usually mathematical) description that according to economic theory is particularly important in the study of a problem. Typically, the model has the form of equation or system of equations describing the isolation researcher interdependence between economic performance [112, c. 15].

GDP dependence on the volume of tourism revenues subjects studied by the methods of econometric modeling.

As the dependent variable in our model used indicator Y (incomes of tourist activity million) and be independent - x1 (number of hotels and similar accommodation) and x2 (number of sanatoriums of treatment).

In order to account for the influence of other factors on the resultant variable in econometric models introduce additional regressors single member of x0 for free, bringing classical stochastic regression function takes the following form:

$$(2.2)$$

and for the individual and the first element - is:

$$(2.3)$$

The additive value of u in econometric models reflects the deviation of actual data values dependent on simulated.

$$(2.4)$$

where X - matrix consisting of 6 rows and four columns (tab. 2.9);

* Source: developed by authors

Naturally, research any model may have practical value if it is adequate to the phenomenon under study is fairly well reproduces the real situation.

Econometric model that explains the behavior of one indicator is a single equation, a model which describes the change of several indicators - with the same number of equations. The model can also be identity, reflecting the functional relationships in a particular economic system. Since this model combines not only theoretical, qualitative analysis of relationships, but empirical information is in it, as opposed to just an economic model, stochastic remains always available. It probabilistic characteristics of these residues contribute to the quality of an analytical model form. Econometric model - a system function or functions describing correlation and regression relationship between economic performance, and depending on the causal relationships between one or more of these indicators are considered as dependent variables, and others - as independent [112, c. 15].

Sufficiently high level of distress dependence (53%) between variation revenues from tourism in the regions of Ukraine and the distribution of hotels and similar

accommodation, sanatoriums and boarding houses with treatment gives rise to study Depending pair correlation between variation revenues from tourism and the number of hotels and similar accommodation. To represent dependencies used vehiclespreadsheet Microsoft Excel, the results displayed graphically polynomial method (Fig. 2.7).

As a result of the imposition on distribution data regression line, it is picking algebraic expression that provides the maximum value of the index Obtained regression equation - second degree polynomial that eliminates variable trend of multiple determination coefficient of 0.522:

$$y = 3E - 05h^2 + 1755 + 1,162h. \tag{2.8}$$

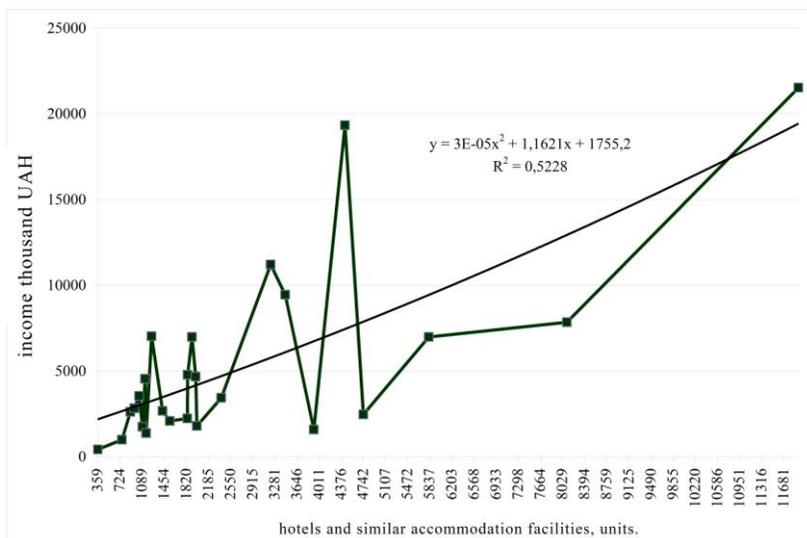

Fig. 2.7. Dependence income of tourist activity on the number of hotels and similar accommodation, sanatoriums treatment

The closer to unity, the stronger the relationship between the study variables. This makes it possible to affirm the close relationship between the incomes of tourist activity

and the total number of hotels and similar accommodation and resorts with treatment.

Thus, other conditions equivalent variation revenues from tourism to 52.2% depending on the variation of hotels and similar accommodation and resorts with treatment, and this dependence is represented as a polynomial function (see. Fig. 2.7).

Simulated our relationship is an important tool of abstraction that helps isolate, analyze and impersonate essential for Ukraine characteristics (properties, relationships, structural and functional parameters) areas of recreation and tourism. To ensure business revenue growth of economic activity, particularly important mathematical modeling, since other experiments this is not always appropriate. Through the use of powerful mathematical tools built our model is the most effective and most perfect method of drawing up plans and forecasts for future periods. In turn, mathematical methods can not be applied directly on reality, but only in respect of mathematical models of a range of phenomena.

To be an effective tool for the study of economic processes, mathematical model must first meet the following requirements [112, c. 21]:

- be based on economic theory and reflect the objective laws of processes;
- play function properly and (or) the actual structure of the economic system;
- meet certain mathematical conditions (solution have agreed dimensions, etc.).

Even though you are using an econometric approach to modeling depending on revenues from tourism and the number of hotels and similar accommodation, facilities or spreadsheet Microsoft Excel, always received a high level of distress communications. This indicates that the regions of Ukraine variation distribution of hotels and similar accommodation,

health centers significantly affects the treatment of income from the provision of travel services.

The availability of recreation and tourism and socio-cultural services depends on the actions of a macroeconomic nature factors, including GDP, expenditures of state and local budgets, income, wages, and sociodemographic characteristics of the population, including citizens of subjective assessments of their needs , which generally determine the choice of priorities in the consumption of services. Here is an analysis of the dynamics of tourism and recreation, social and cultural services for the population consumed 2012-2016rr. (Tab. 2.11)

Table 2.11

Dynamics of tourism and recreation, social and cultural services sold to population by economic activity (including VAT) *

Activity	2012	2013	2014	2015	2016	2016 / 2012%	2016 / 2015, %
The volume of services sold to the population, mln. UAH	58439.5	68905.8	74876.1	80974.2	78837.7	134.9	97.4
per one person USD.	1274	1531	1642	1780	1833	143.9	103.0
Temporary accommodation and catering mln	2738.2	3097.7	3311.6	3673.2	9067.1	331.1	246.8
Health care and social assistance mln	3767.3	5011.7	5153.6	5736.3	4829.0	128.2	84.2

mln							
-----	--	--	--	--	--	--	--

Source: [114, p. 276-277; 74, p. 266-267].

Apparently, there was a growth of paid services sold to the population in 2016 compared to 2012-m p. 1.3 times (mainly due to the price factor, improving economic activity - by 33.6%) in per capita - 1.4; in the arts, sports, entertainment and recreation - in 7.9, temporary accommodation and catering - 3.3, health care - in 1,28 times. Instead activities in the field of education characterized by decrease of 12.7%.

Services in arts, sports and recreational facilities, temporary accommodation and catering, education, health care and social assistance were unequal structure for 2012-2016rr.

The share of services arts, sports, entertainment and recreation in the total volume of paid services rendered to the population increased by 14.1%, temporary accommodation and catering - by 6.8%, and education services decreased from 5.2 to 3.4%, or 1.8%, health care and social assistance to the population - by 0.3% (tabl.2.12).

Thus, the provision of recreation and tourism, social and cultural services to the population growth trends have paid services temporary accommodation and food services, arts, sports, entertainment and recreation and limit public access to essential social services - education, health care and social assistance - and, consequently, increased social differentiation for their consumption. In this regard the prospects for providing recreational and tourist paid services should be assessed taking into account changes in the cost of services, resulting in a possible redistribution of consumer spending patterns of households, which affects the level of public recreation and tourism services [39, p. 324].

Table 2.12

Structure of recreation and tourism and socio-cultural services sold to population by economic activity,% *

* Source: compiled according to the State Service Statistics of Ukraine

Since 2012, the structure of consumer spending is amended as follows: the cost of trips to holiday homes, the recreation centers, camps, etc. - to "Restaurants and hotels", namely group costs for services related to temporary accommodation. In previous quarterly publications, these costs are included under the sections "Miscellaneous goods and services" and "Recreation and culture". Benefits to pay for trips to holiday homes on recreation in the camps, etc., are taken into account as a part of total household expenditures also included to "Restaurants and hotels" [115, p. 353].

Costs for recreation and tourism services by households Ukraine characterize social differentiation of the population in terms of consumption of these services. Consider the distribution of household expenditures by income level on socio-economic and decile groups. According to the State Statistics Service, in the first place, using eleven groups represented interval number of household expenditures depending on the size of income. This approach is mainly used to study household consumption of services depending on their financial capabilities. Second, using statistical grouping households by decile (10% - to) groups, allowing you to

provide a qualitative assessment of differentiated services consumption by the criterion of justice [39, s.325]. So,

Analysis of the dynamics and structure of cash household expenditures for the 2012-2016 biennium. Shows that the effective demand for recreation and culture and restaurants and hotels, healthcare, ahead of the demand for education in all socioeconomic groups in terms of income. Overall spending on recreation and culture and restaurants and hotels, healthcare and education for all groups of households with minor differences.

Characteristically, in malodohidnyh populations (from 300 to 1020hrn - 2012 and from 480 to 1,560 USD - 2012-2016.) The cost of recreation and culture and restaurants and hotels, health and education in the dynamics differ slightly, indicating a low level of satisfaction of needs for these services. In medium and high-yield group of household expenditure on recreation and culture and restaurants and hotels, health ahead of spending on education. Most clearly discernible trend over the 2012-2016 biennium. For example the distribution of household expenditures by decile group (ext. Z.2-Z.3).

In households that belong to five to ten deciles, spending on recreation and culture significantly higher than in the first-fourth. In the last two deciles households (ninth and tenth) the cost of recreation and culture are the highest, indicating that these kinds of needs are met only wealthy people. Thus, the cost of this service are more differentiation in decile groups than socio-economic groups.

In respect of the main trends in effective demand for services during the 2011-2016 biennium., Special interest is the distribution structure for household self-assessment of their income, depending on the amount of increase in money income (ext. Z.4- Z.5).

According to the economic expectations for the next 12 months decile groups depending on the size of average

equivalent cash income in 2015 malodohidnyh populations prevail costs physiological needs: clothing, footwear, shelter, food and medical treatment. Thus in the second, third, fourth and fifth groups of paid services need rest goes to the first place (rys.2.8, ext. Z.6).

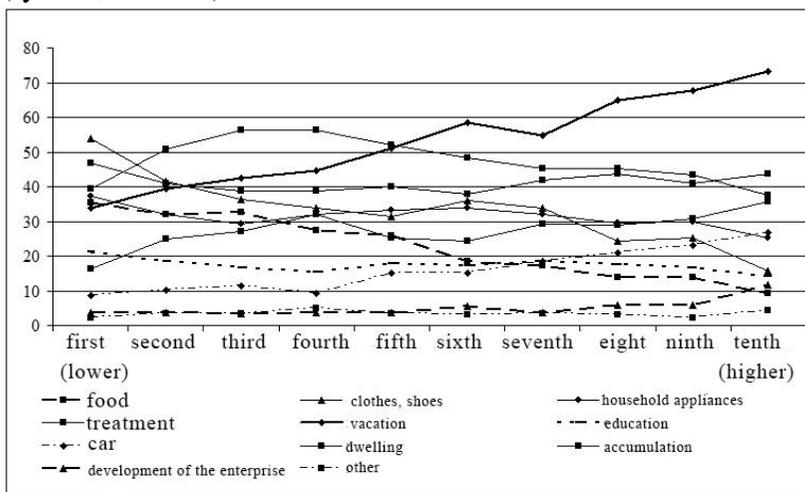

Fig. 2.8. The distribution of households by income level, economic expectations for the next 12 months decile groups depending on the size of average equivalent income, 2016.

To analyze the quality of life State Statistics Service of Ukraine in October 2015 conducted a modular survey of 10.6 thousand. Households that participated in the Survey selective regarding their income and consumption capacity. The program included research study perception of signs of poverty and deprivation (deprivation) in their consumer opportunities and analysis of distribution to households in certain manifestations of deprivation of opportunities to not only meet the required minimum physiological needs, but also those related to the development of personality and providing adequate comfort level of existence [116].

According to the survey of rural residents than urban, suffered from almost all forms of poverty and deprivation. A significant portion of households had no money for a family vacation away from home, and not with relatives in their home for at least one week per year (45% of rural and 37% urban households).

Deprivation associated with low infrastructure development, particularly related to tourism development, experienced 46% of rural (urban - 4%) households due to lack of facilities providing personal services, 42 (4) - because of insecurity settlement services ambulance, 29 (6) - in the absence near the home health agencies, 25 (2) - in the absence of regular daily transport to another settlement with more developed infrastructure and 15% of rural (urban - 2%) - because of the lack of housing near retail facilities [116].

World experience shows that developed economies depends on how the young restaurants, shops, service centers, hotels, travel agencies, local factories. Small business long they took shape in an independent department of small business. Such enterprises are mobile, manoeuvrable and efficient because of the costs of its activities are close to consumers (tourism, trade, manufacturing and services), able to respond quickly to changes in demand and take into account the wishes of customers. Creating a significant number of jobs and taking a significant share in GDP, small business forms the core of guaranteed employment most of the population and ensure its prosperity and play a stabilizing role in the political society [117].

Unfortunately, Ukraine has not created the conditions for sustainable development of small business and its level is low. Small (regardless of ownership) defined entities in which the average number of employees during the reporting fiscal year does not exceed 50 people, and gross revenue from the

sale of goods (works, services) during this period is not more than 70 Million [118].

The value of small businesses in the national economy and in particular the tourism and recreation sector is as follows:

Firstly, employment, ability to create new jobs to absorb surplus labor - the main feature of small business, because when large enterprises, a reduction in jobs, small firms not only retain, but create new jobs;

Secondly, small business, as the competition in itself, helps strengthening competition. Harakteryzuyuchys many constituent elements and high dynamism are much less exposed to the monopolization compared to large enterprises. At the same time, in terms of specialization and use small business innovation is an effective competitor, undermining the monopoly position of large corporations;

Thirdly, the sector responsive to changing market conditions, customer demands and market economy provides more flexibility;

Fourth, small business serves easing social tensions and democratic market economy, because it is fundamental to the formation of the middle class population.

So small businesses in the recreational and tourism sector - a required element of a market economy, the engine of economic and technological progress in society, an important stabilization mechanism and means of implementing a particular business potential of the population.

Analysis of the statistics shows that during the 2012-2016 biennium. The proportion of employees of small businesses in the total number of employees was 26,1-25,9% of economic activity, particularly in enterprises that conduct real estate transactions - 62, 9-70,9, temporary accommodation and catering - 50 7-45,3, education - 47,6-57,9, wholesale and retail trade, repair of motor vehicles and motorcycles - 43,1-37,9, health care and social assistance - 35,9-46,9, art, sport,

entertainment and recreation - 34,9-26,2, Activity in administrative and support services - 39,8-34,7%. Consequently, it is in these kinds of economic activity preference among small enterprises, while in industry - only 11,4-11,7%, agriculture, forestry and fisheries - 24,4-31,

But, unfortunately, small businesses do not perform the role of a leading sector of the market economy, as evidenced by their performance and economic activity, the share of sales (goods and services) 2012-2016. Was 16,9-17,2% of total sales enterprises by economic activity, particularly in enterprises that conduct real estate transactions - 57,3-58,2%, temporary accommodation and catering - 31,2-32,3, education - 38, 9-58,5, wholesale and retail trade, repair of motor vehicles s vehicles and motorcycles - 25,1-22,7, health care and social assistance - 23,8-30,3, art, sport, entertainment and recreation - 26,5-7,1, in administrative activity and support services - 45,2-38,6% [74, p. 288-289].

Table 2.14

* Source: developed by authors

A large proportion of small businesses in this area were unprofitable (2012 - 41%, 2016 - 33.7%) [74, p. 304-305]. This confirms the need for sound public support small businesses in the field of recreation and tourism Ukraine, closely interconnected with obtaining social effects, increase living standards.

SECTION 3

STRATEGIC PROSPECTS recreation and tourism IN UKRAINE

3.1. Status and trends of recreation and tourism

Tourism - recreation area in Ukraine is about 9.1 million. Ha (15% of the territory). Prior to the adoption of the Law of Ukraine "On resorts" in Ukraine the Council of Ministers of the USSR, USSR Council of Ministers approved the boundaries of districts and zones of sanitary protection 27 resorts and provision of 33 resorts. Currently, the formal features to resorts include only 27 areas, while legally none of the resorts fully meets the requirements of the Law of Ukraine "On the resorts."

The Law of Ukraine "On resorts" involves the creation of the state cadastre natural resort areas of Ukraine. Failure to work on defining the boundaries of districts and zones of sanitary protection of resorts prevents development and

approval of master plans resorts adjustment planning documentation settlements resort areas. The negative consequence of this is the systematic violation of laws on land use and rekreatsiyno- turestychnoho resort destination.

The concentration of industry and agriculture within resort areas creates excessive human pressure. Because of underfunding and anti-erosion measures destroyed coastal areas and beach resorts.

Operational reserves of mineral waters ensure their use in volume over 64 thousand. Cu. meters per day, of which only 8% is used.

State inventory of natural medicinal resources Ukraine is not developed, is insufficient state control over their rational use and protection, adherence sanitary protection zones and so on. In general we can say that natural resources are used effectively, there is a danger of damage and destruction.

The situation in tourism and activities resorts in Ukraine is characterized by the following main factors:

- nyzkym level of awareness of the country's population and the authorities which regulate in tourism resorts and activities, the role and importance of tourism to the socio-economic development;

- absence existing tourism resources and integrated system of management, uncertain areas of their development and development pozazakonnym and inefficient use of unique natural, historical and cultural resources;

- the lack of an effective system of protection of rights and interests of tourists, ensuring safe conditions at the sites of tourist visits and the areas of tourist routes, the timely provision of all types of emergency aid to victims during the trip;

- lack of favorable conditions for the development of the tourism industry, the state investment policy in the field of tourism resorts and activities and adequate support for the

development of priority tourism, including inbound and domestic, agricultural, environmental,

- the destruction of social tourism, tourism for practical inaccessibility of the poor, children, youth, elderly and special needs;

- lack of proper forecasting and planning of tourism, tourist flow parameters according to the available resource capacity, needs of the population and economy of the state, superficial and fragmented approach to the development and implementation of state and local tourism development programs;

- imperfection of organizational, legal and economic mechanisms of state policy in the sphere of tourism resorts and activities, weak interagency coordination and cooperation between state and local authorities;

- lack of a coherent and integrated management of tourism resources of the country, different subordination tourism resources, lack of specially authorized central executive authorities on the activities of resorts;

- insufficient normative, methodological and information support of local government, community organizations and businesses in the tourism resorts and activities;

- lack of quantitative, qualitative parameters and the structure and level of scientific, methodical and staffing, particularly in management at the state and local levels.

On state registration in Ukraine is over 130 thousand. Sites, including: 57,206 - archeological sites (418 of which are of national importance) 51364 - monuments of history, 5926 - a monument monumental art, 16293 - 'S interest of architecture, city planning, 3541. garden art and landscape

Operates 61 historical and cultural reserve, 13 of which have national status. The list of World Heritage Sites includes:

Sophia Cathedral architectural ensemble of Kiev-Pechersk Lavra in. Kiev historic center of the city. Lvov.

Up to 70% of cultural heritage is in poor condition (one tenth facility in an emergency) and calls for work on the restoration and reconstruction, construction of tourist visits.

The low level of development of cultural tourism, caused mainly lack of legal provision on the use of cultural heritage tourism, limited transportation access most objects, abandoned objects of cultural heritage, not preparedness museum exhibitions and surrounding areas to travel visitors, including foreign tourists and people with disabilities. Most museum exhibits thematically complex and are based on outdated methodologies and technologies. Impede appropriate use of cultural heritage failure tourist guiding professionals and their skills inadequate. In the country the scientific and staffing in tourism carried out more than 130 universities,

If there is such a significant scientific potential is currently no practical recommendations to government regulation, integrated planning schemes, rational use of tourism resources, economic principles of functioning of tourism.

The current system of training generally does not provide the needs of tourism resorts and activities for specialists of middle and lower level managers who directly serve tourists. There are no standards for educational training, which is produced within existing professions not specialized literature and textbooks in the state language.

However, there is a state tourism infrastructure. According to State Statistics Committee, in Ukraine there are: 1,2 thousand. Hotel industry establishments with total capacity of 104.0 th., Which annually serves about 4.0 million. People, 17.5% of them - foreigners. Average hotel load fund is 31%; In addition there is 3.3 thousand. Sanatorium and recreational facilities with a total capacity of about 481 thousand. Beds month maximum deployment. Number of unemployed

institutions - 22%. Generally spa and wellness facilities each year taking about 3.2 million. People, 14% of them - foreigners. Power establishments used less than 40%.

On January 1, 2006 85% of hotel management schools are not certified to meet specific category and 34% - for compliance with safety requirements. According Gospozharnadzorom part of accommodation does not meet fire safety requirements.

A large number of accommodation morally and physically obsolete and have low competitiveness, annually uses them only 7.5% of the total number of foreign visitors Ukraine. Most of the funds spent on construction and renovation - own funds, domestic and foreign investments account for only 35%. Work on the reconstruction of privatized assets held back, largely due to lack of funds required from the owners.

The structure of the hotel establishments of Ukraine in terms of capacity and number of employees is not optimal. In recent years, tourism and recreational areas there was a significant number of private households that provide services for temporary accommodation. Lack of approved boundaries of districts and zones of sanitary protection of resorts makes it impossible to determine the number of such establishments. However, income households from providing accommodation in most cases are not properly taxed and their activities significantly increases the burden on local budgets in the maintenance of utilities and transport infrastructure and public services.

Transport and utility infrastructure of most tourist recreational areas characterized by: low levels of integrated transport networks and spatial (road) unity, roadside service and information arrangement, poor state of road surface and road safety, which affects the accessibility of tourist resources, reduces mobility and quality national tourism product. Roads of

national importance first category (with four or more lanes and carriageway width of over 15 meters) have a length of 2,254 kilometers, or merely about 1.4% of the total length of the road network paved Ukraine. In rural areas, almost 30% of farm roads subordination are not hard coating and during bad weather conditions become unsuitable for use. To achieve security of Ukraine roads of Europe need to build and upgrade nearly 200 thousand. Kilometers, including 60% in rural areas.

Municipal Engineering is one of those areas, the level of which directly influences the development of tourism. Most acute problem is the availability of safe drinking water. Average water consumption is 320 liters per day per person, in 2 - 3 times higher than in EU countries. The analysis of the current state water management sector suggest that environmental issues become more and more extensive manner, a sharp deterioration of the main sources of drinking water. Lack of development of modern technologies are recycling and processing waste, landfills presence within the tourism and recreational areas, creating a significant environmental hazard like.

Weak growth has a network of tourist information centers, travel no representation Ukraine abroad and the official information portal, through which tourists, including foreign, could obtain information on national and regional tourist products.

3.2. Background and factors of development of recreation and tourism Ukraine

Measuring the impact of social functioning areas of recreation and tourism should include first of all assess the potential of this area, opportunities and conditions for its

development both in individual regions and the country in general. Based on the evaluation of existing potential, we can further analyze efektyvnist this sector, which, on one hand, the social dimension and manifested in the restoration and development of the vitality of man and society, on the other - is characterized by economic indicators and the state of development of recreation and tourism. The set preconditions and factors of development of recreation and tourism includes the availability of appropriate resources (potential) political, economic, legal, technological, infrastructural environment. There are the following groups of factors in its development: static and dynamic. The former include natural and geographical (nature, climate, topography, rich underground mineral resources), cultural and historical factors are held constant. People just adapt them for recreational purposes, making more available for use. Demographic, social, economic,

- external and internal. External - a demographic and social changes, economic and financial factors, changes in the political situation and legal regulation, the development of transport infrastructure, trade and so on. Internal factors act directly in the study area and associated with the organization of recreational and tourism activities [39, p. 278; 68].

Potential (n. BUILDING, Eng. potential, it. potentialn) - the opportunities available forces, supplies, tools that can be used [69]. The concept of the recreational and tourism potential covers all the features available forces, supplies, tools that can be used to meet the needs of the population in the area of recreation and tourism in order to create social and / or economic benefits.

Recreational resources or prerequisite for the development of recreation and tourism are the natural conditions, natural sites, and any other resources of natural origin that may be used for the treatment, rehabilitation, recreation and tourism [70, p. 104]. Thus, recreational

resources - a combination of natural resources, socio-economic conditions and cultural values that are prerequisites for recreational needs of individuals and organizations on complex commercial and recreational public service [71, p. 138].

Recreation resources include natural recreational, cultural and historical resources, social (recreation and tourism needs, purchasing power of the population) and economic (institutional and infrastructural support) conditions and resources.

Thanks to the availability of sufficient climatic, cultural and historical resources in the Ukraine has all the prerequisites for the development of many types of recreation and tourism. And in most parts of all the components available recreational resources, enabling them to actively enter the tourism market.

Natural recreational resources Ukraine is extremely diverse and include: recreational landscapes (forest, coastal, mountain), health resources (mineral water and mud), natural protected areas (national natural and regional landscape parks, biosphere reserves, parks, monuments, garden art, etc.) , the territory of historical and cultural purposes (monuments of architecture and urban planning, historic and architectural reserves, etc.). [61].

Natural recreational resources are divided into climatic, Flora-fauna, landscape, mineralogical. To climate include: snow, comfortable temperatures, periods of maximum solar radiation, the duration of the light of day, humidity, wind speed and more. Flora-fauna resources represented keeps bee and medicinal plants, hunting and fishing grounds, etc; landscape - terrain, mountains, forests, rivers and lakes, coasts and beaches, protected areas and objects like. Possibility of water recreation (boating and sport fishing, hydrotherapy, bathing-beach holiday) depends on the water quality, bottom, beach strips and aesthetic properties of the environment.

The leading role of landscape resources is covered with forests, parks, parks, green areas of cities. Recreational forests account for about 10% of all forests of the state forest fund. Phytocuring resource limited settings recreational use of forests, water protection, their protective properties, healing effect on human health and hygiene favorable backdrop for treatment, recreation, tourism [63].

Lisolikuvalni resources in Ukraine are quite uneven. Most forests are concentrated in the southwest region of the state. Forestry and forest-park zones main types of recreational and tourism activities are tourism and sports (hiking and ski tourism, equestrian sports and hunting license, orienteering, etc.); climatic and phyto; generall rest; gathering berries, mushrooms, herbs and more.

Protected areas and objects a special place in the structure of landscape resources, namely reserves and sanctuaries different forms and directions conservation, national parks, arboretums, valuable natural objects, monuments of nature and landscape gardening culture. Recreation and tourism activities in such places is allowed only to the extent that guarantees the preservation of these natural systems. Reserves and national parks created to preserve, reproduce and efficient use of natural complexes and objects which have a special nature, recreational, historical, cultural, scientific, educational and aesthetic value [72, 73].

In Ukraine, the number of nature reserves and national parks and their area has increased in recent years, particularly in 2015 compared to 1990 m - respectively 3.38 and 4.15 times (tab. 3.1).

Table 3.1

The number of natural reserves and national parks in Ukraine, by year *

Source: [74, p. 481]

As part of the natural and recreational resources of importance due Therapeutic properties have the mineralogical resources such as mineral water and mud. The first are natural waters with medicinal properties that define the basic lithium salt composition or a high content of bioactive components and gases, radioactive materials, high temperature. Mineral water baths Ukraine include major groups, namely:

A - water without specific components and properties, the therapeutic effect of which caused major ion composition and general mineralization. They are used at resorts Mirgorod (Poltava region), Kuyalnyk (Odessa), Truskavets (Lviv), Feodosia (Crimea), Ochakiv (Mykolaiv region) and others.

B - carbonated water, curative properties are associated with the presence of large amounts of dissolved carbon dioxide and ionic composition and general mineralization. Used in the resorts Glade (Zakarpattia region), Pigeon in the sanatorium "flower meadows" Soimy- the sanatorium "Verkhovyna".

B - sulphide water, physiologic and therapeutic effect which is caused by the presence of sulphides (free sulfide ion and hidrosulfidnoho). Used in the resorts Great Luben (Lviv region), bruises (Zakarpattia), Church (Ivano-Frankivsk region).

D - iron, arsenic or arsenic water with high content of manganese, copper, aluminum. The therapeutic effect is due (other than their ionic and gas structure and mineralization) one or more of these pharmaceutical active ingredients. Used in the sanatorium "Mountain Tisa" (Transcarpathian region).

∞ can - bromine, iodine and high in organic matter of water used in the resorts of Truskavets (Lviv region), Berezovskaya mineral water (Kharkiv region).

D - radon (radioactive) water used in the resort Khmilnyk (Vinnytsia region) [75, p. 389-390].

Consequently, most of the mineral water is concentrated in the western part of Ukraine, in particular Zakarpattya and Luhansk, Dnipropetrovsk, Poltava, Rivne, Ivano-Frankivsk, Kharkiv, Zhytomyr, Vinnytsia, Khmelnytsky, Kyiv, Cherkasy, Donetsk and Zaporizhia regions. Some sources were the basis for the formation of such famous resorts as Khmilnyk, Truskavets, Morshyn, Nemiroff [62].

The second component mineralogical resources - mud, which are deposits of ponds, marshes (or its site), mud hills. They can be used for therapeutic purposes in health centers, dispensaries near fields, export to other hospitals, import. Ukraine has very significant reserves of therapeutic muds, which are concentrated mainly in southern and south-western regions. On the basis of mud deposits in Ukraine operate oldest mud resorts - Berdyansk, Yevpatoriya, Kuyalnyk, Saki, Khadzhybeysky more. In the north-western areas of common peat mud which they are used at resorts Mirgorod, Morshyn, Nemiroff, Cherche more.

Total area of developed and potential recreational areas in Ukraine (without radiation contamination) is 12.8% (2013) of its territory and distributed according to the same natural features recreation areas: Carpathian, Transnistria, Dnipro, Donetsk-Azov, Poleski, Black Sea. In determining these regions is taken into account the following factors: geopolitical position (location area, the availability of human resources, transportation routes, sources of raw materials, energy, history of the territory, traditions, etc.), Availability of recreational resources, the state of tourism infrastructure, the demand for recreation and tourism, recreation and tourism policy in the region [62].

Usually, recreational resources are considered cultural, historical, including: historical, archaeological, architectural, ethnographic objects and cultural institutions (historical, archaeological and architectural monuments, works of monumental art, ethnographic heritage, folklore, arts centers and crafts museums, theaters, etc.). Their defining characteristic is the value, attractiveness, cognitive potential. Of great interest for the development of domestic and international tourism are -arhitekturni historical monuments of Kyiv, Chernihiv, Lviv, Odessa, Kherson and other cities.

Thus, Ukraine has a powerful capacity (natural, historical and cultural) for development of recreation and tourism. However, the development of national tourism and recreation exposed to significant aggregate environmental factors: political, economic, legal, infrastructure, etc., reflect the characteristics of social organizations in the country, formed historically.

An important prerequisite for the development of recreation and tourism needs of the population is defined as its social characteristics (mental, cultural and national features) and the ability to implement the economic costs related service (actually effective demand). The importance of recreation is

increasing against the background of the growing influence of the negative effects of NTP, including deterioration of the environment and the consequent public health. According to the study, improvement allows reduce the costs of temporary disability per employee per year for 3-4 days, to reduce the loss of working time reduction of mortality in working age for 6-7 days every year, to reduce exposure to treatment in the hospital for 2-3 days, increase productivity by 3%, reduce the number of visits to clinics 2 times [33,

Significant impact on the choice of methods and Recreation has a level of material security of the population. Depending on the income level of consumers recreation and tourism can be divided into three groups. The first group includes those with low incomes (teachers of schools and vocational schools, nurses and other public sector employees). Nevertheless, they exhibit relatively high activity against a variety of entertainment, recreation, sightseeing activities, purchase small gifts and so form the largest segment of consumers recreation and tourism in the international tourism exchange. The second group are people with average incomes (businessmen, doctors, university professors and others.), The primary purpose of outdoor activities related to cultural and entertainment events, and wellness-treatments. People with high incomes who show interest in the study of nature, culture and traditions of other nations and able to spend on tourism and recreation heavily form the third group. The structure of the market of recreational services also affects age population. Accordingly, tourism is divided into youth - those aged 15-29; adult - 30-59 and third age - 60 years and older.

On the recreational needs of the population affected by both subjective factors (tastes, preferences, fashion and various types of recreation areas, advertising, stimulating demand for recreational services, for cultural, sports, fairs and other events), and so the objective (eg , changes in household

income). Currently, only a small part of the population of Ukraine has the opportunity to meet their full recreational and tourism purposes in connection with the fall of solvency. So today should pay more attention to the development of suburban recreation for gardens, cottages in the countryside, cheap hostels, campgrounds, motels.

The external factors influencing the formation and functioning of the national tourism market include economic and political stability in the country, government policies supporting tourism activity and orientation of international activities, degree of integration into the world economic system, and fashion and image. The interaction of internal and external factors shaping the market conditions and business environment activities affect demand (its size, structure, rhythm). The level of development of the national tourism industry depends on the ability to meet the needs of different consumers.

Among these factors distinguish extensive, intensive and dissuasive. The former include the growth of the number of employees, amount of material resources to be included into circulation, build new recreational facilities; to intensive - training of personnel, professional and qualification structure and technical and technological base, rational use of material resources and more. Restraining factors affecting development of recreation and tourism and embrace the economic crisis, the growth of foreign debt, political and financial instability (inflation, stagnant rates), higher prices for commodities, unemployment, decline in personal consumption, poor environmental situation, bankruptcy of travel companies etc. [76, 77].

Stability and formation of the national tourism market largely depends on the relationship of international and domestic tourism. Sustainable development of the national tourism provided by the presence capacious domestic tourism

market, which is also the basis for the development of international tourism. In Ukraine, there is every reason for the formation of a strong market reception of tourists and generate market flows [78, p. 59-60].

This is largely ensured by purposeful state tourism policy aimed at creating an attractive image of the national sphere of recreation and tourism. Tourist attraction formed complex resources and activities, including:

- existing tourist resources (natural, historical, cultural);
- environmental situation in the country and some regions;
- pricing and transportation access offered tourist services;
- traveling comfort and quality of service.

Economic background - the development of business, the availability of human resources, capital, favorable environment for economic activity and more. Terms of the national tourism market is the level of national economic complex (especially related to tourism sectors), creating the possibility for the formation of appropriate tourism infrastructure (networks of different types of accommodation different levels of comfort - hotels, motels, tourist centers, etc., engineering infrastructure).

The most important prerequisite for the effective development of recreation and tourism is the availability of recreation and tourism infrastructure, hotels, motels, rest homes, boarding houses, sanatoriums, catering, transport, entertainment facilities, attractions and so on. It is worth noting that at the beginning of 2016. in Ukraine there were 1258 enterprises hotel industry a total of 100.67 th .. The form of ownership are distributed as follows: 40% in state and municipal property, 57th collective and 3% - in private. Recreational opportunities provided by Ukraine as the presence of 3304 sanatorium and health institutions of different

departmental subordination and forms of ownership, including resort - 487, health center - 357, bases and other establishments of rest - 2016, pensions holiday - 235

For the development of recreation and tourism infrastructure is a very important premise: transport security, adequate social infrastructure and material production, which contributes to recreation and tourism activities in the region, economic and geographical position, the nature of settlement in recreation areas and more.

In its functional purpose infrastructure recreation and tourism industry is divided into industrial (transport, communications, construction, water -, energy) and social (retail, restaurant business, community services, culture, children and medical institutions). An important condition for the formation of the national tourism market and its interaction at the regional and global levels is developed transportation component of the appropriate traffic, economic and formal accessibility [79].

Unfortunately, the state of transport infrastructure in Ukraine is extremely poor, it needs significant investment to create it in accordance with the world standards. Our country has to develop a network of highways and railways, airports, sea and river ports. Air, road, rail and river transport should provide transportation of tourists taking into account global conditions and quality of service [58]. Do not lose relevance problem of water supply and sanitation settlements, especially tourist centers and recreational areas.

For improvement of infrastructure in Ukraine required a substantial investment in its construction, including the central and local authorities, foreign and Ukrainian investors by the state, regions and communities.

Thus, the development of the national tourism market depends on a complex objective conditions and the factors that contribute to the formation and functioning of the national

tourism industry as interbranch complex to create a tour product. The latter has to meet the specific needs of people on leisure trips through the production and sale of goods and services tourist destination. Development of tourism should be consistent with national tourism policy, which - coordination of business and government efforts to strengthen the position of the country in the global tourism process, the global socio-economic and socio-cultural systems.

In our country formed all the prerequisites for tourism development and its tourism potential is currently not fully used, because the share of tourism in GDP accounted for only 1.5-2.5%. The main stimulating factors in this context are mainly infrastructural changes.

In general recreation and tourism Ukraine is developing dynamically, growing numbers of tourists and sightseers, and the amount of receipts from tourist services (tab. 3.2).

Table 3.2

Source: author calculated according to the State Statistics Service of Ukraine

At the same time there is a clear trend of domestic outbound tourism: the rapidly growing number of citizens traveling abroad for tourism, while the number of those who enter the country as well as domestic tourists is decreasing. Unfortunately, reduced foreign direct investment and development in the resort and tourist infrastructure (rys.3.1), the number of domestic tourists and tourists as well as foreigners who visited Ukraine for tourism. The sharp decline in living standards in the years 2014-2015. Probably will keep these trends will reduce the exit flow, but is unlikely to contribute to the growth of internal streams of tourists. Therefore need innovative solutions to enhance the use of existing capacity, the creation of new tourism products, competitive in Ukraine and abroad, support SMEs in the tourism sector, improving the quality and availability of

recreational and tourism services. The implementation will lead to systemic measures, according to our calculations, the increase in the number of tourists in 2025 to 6 million., Ie 3.2 times, including 1 million. Foreigners (2.9 times). The increase in domestic tourism, particularly social, will provide a congestion accommodation facilities and implementation of tourism potential accumulated. By 2025, the level of budget spending on tourism will reach 0.3% of GDP (see. Rys.3.1) [39, p. 283]. including social, will provide a congestion accommodation facilities and implementation of tourism potential accumulated. By 2025, the level of budget spending on tourism will reach 0.3% of GDP (see. Rys.3.1) [39, p. 283]. including social, will provide a congestion accommodation facilities and implementation of tourism potential accumulated. By 2025, the level of budget spending on tourism will reach 0.3% of GDP (see. Rys.3.1) [39, p. 283].

The experience of many European countries that have significant income from international tourism, it is advisable to create a tourist representative offices abroad to promote national tourism products.

In recent years, the tourism sector is undergoing profound positive changes, new routes, developing hotel infrastructure, increasing the level of tourist services, improving attendance tourist sites, tourist and recreational opportunities in Ukraine caused great interest among representatives of the international tourism industry [82]. The above significant impact on the dynamic growth of tourists and revenues from tourism.

However, the development of tourism in Ukraine is constrained by several factors: the lack of an integrated system of state management of tourism in the regions; lack of technical, organizational, informational and financial support entities tourism industry of the country; mismatch most tourist facilities with international standards; poor state of the tourism,

service and information infrastructure in the areas of roads and international transport corridors; insufficient supply of highly qualified tourism industry; imperfection regarding database objects tourism industry.

Within the framework of the State program of development of tourism specific issues have been resolved. In order to improve the situation in the tourism sector developed and adopted the Law of Ukraine "On Tourism", the Decree of the President of Ukraine "On measures to develop tourism and resorts in Ukraine." These regulations stipulate the main directions and prospects of tourism development in Ukraine.

Currently, tourism is adapting domestic legislation to international standards, improved contractual framework signed 40 international agreements on cooperation in culture and tourism with leading institutional bodies. In Ukraine carried out joint projects on the initiative of a number of international organizations to preserve the environment, deepen cooperation, economic and social development of potentially attractive aspect of tourism areas.

Today unconventional required innovative approaches to the management of the tourism sector in Ukraine at the level of the state and enterprises. Sustainable development of the domestic tourism industry against the backdrop of increased competition, increased demand for international and domestic travel products, customer requirements to fill, diversity and quality of tourism and recreational services requires science-based marketing strategy [83, 84].

With the growing economic and social efficiency recreational and tourist areas will be formed favorable conditions for sustainable economic growth, job creation, maintenance revenue and revenue. Achieving this is possible only through constant active promotion of local products to domestic and international tourism market, Improving the

competitive advantage of domestic tourism product manufacturers.

The state should encourage recreational and tourist activities in general, creating the necessary economic and political conditions, maintaining its overall image recreation and tourism the country, including funding for large-scale foreign and national PR-action. This will contribute to advertising attractive for recreation and tourism areas at both the national and international markets in languages strengthen globalization. In this connection it is necessary to state and local budgets provide the funds.

It is known that one of the priorities of socio-economic growth of the country, a significant factor of stabilization and structural adjustment of the national economy determined the development of recreation and tourism. It is said, particularly in the State Regional Development Strategy for the period up to 2020 [57].

Recreation and tourism might be a priority in the development of any modern state, if it has the necessary natural-resource potential and can increase investment activity, the implementation of strategic growth scenario, recreation and tourism competitiveness in domestic and international markets services.

In its tourist and recreational potential of Ukraine can become a tourist country of the world. Expanding international relations opens up new ways to promote the national tourist product on the international market, attracting global information space, excellence organization of tourism [59].

Geostrategic role of our country as a link between north and south Europe, Caucasus and Europe is obvious. Ukraine is open for international tourism cooperation based on common European integration processes and national priorities. Based on national priorities, public international tourist policy The opposite is implemented on the basis of economic feasibility

and mutually beneficial cooperation with a particular country or region, takes into account the specific features of the tourist market. [60]

The development of logistics recreation and tourism will depend on many factors: the recreational and tourist activity rate, increase its revenues, fluctuations in the price of the permit, the pace of economic reforms, introduction of Ukrainian currency and its convertibility, saturation commodity market, liberalization of foreign trade and so on. Because it processes to predict the Long-Term extremely important. In the immediate future, obviously, be kept downward trend in living standards. The main contingent of tourists will be provided with the most material part, so important is the question of government subsidies in the spa area.

Thus, we can conclude that Ukraine has a huge potential for recreation and tourism, which is characterized by its natural resources, availability of skilled personnel, material and technical infrastructure (an extensive network of recreational centers, hotels, etc.). The presence of substantial capacity allows countries to set ambitious targets for accelerated development of recreation and tourism, turning it into an important factor in human development. However, to bring the infrastructure into line with international standards of service quality required significant investment. Needs improvement mechanisms and ways to use existing facilities in the context of the goals of recreation and tourism.

3.3. Investigation of the stability and reliability of the current state of the tourism complex

In a globalized economy using climatic recreation and tourism resources driven by their specific functional purpose, which determines the priority profile of the tourism development of certain areas, regions and locations. However, if at the functional purpose of certain resources can be made more or less clear distinction between subhaluzyamy recreational sector (tourism, leisure, sports, spa treatments, etc.), the study of spatial organization of natural resources required is a comprehensive approach. Therefore, the recreational-tourist suitability riznoranhovyyh regional economies monofunctional not actually happen - they are all to some extent, can meet the needs of tourist services or spa sanitation. This realization of specific functions of economic regulation of the tourism industry in the market possibly in the presence of four main components: a) capital; b) technology; c) personnel; d) tourism resources. That means that not having the capital to purchase technology, hire staff and begin to engage in tourism. It is necessary to determine the place where the fourth component - tourism resources - is the cheapest, overall it determines the high profitability of tourism. But if tourism associated with the creation of tourist resources (rather than the consumption of ready-made), the cost of the tourist product is gradually increasing as tourism resources by means a series of natural and artificial man-made objects suitable for creating tourism product , we can confirm that determine the formation of tourism resources of tourism in a particular region. The author found that the main criteria that determine the suitability of the area for spa treatments is the presence of deposits of medicinal mineral water, wax, favorable climate, clean

environment. The greater supplies of medical resources, the higher their therapeutic efficacy, the higher value are recreational areas. That such area is small in size, limited to the boundaries of the settlement, which houses the spa resources.

As you know, the natural potential of Ukraine make up the Black and Azov seas, relief, water (70 ths. Rivers, more than 3 thousand. Natural lakes and 22 thousand. Man-made reservoirs), forest, plant and animal resources. On this basis, established 11 national parks, 15 national parks, preserves, arboretums, memorials of landscape art belonging to the protected areas. The deposits of therapeutic mud, mineral and radon waters belong to the recreational potential of our country, which is not only domestic but also international significance. Travel Resources have such basic properties as attractive, climatic attractiveness, availability, degree of scrutiny, excursions importance, and video landscape and environmental characteristics, socio-demographic, natural reserves, how to use and so on. These resources are used in health, tourism, sports and educational purposes. Thus, in the Carpathian region have the resources to sports type of recreational activity [136]. This includes skiing, tourism, hunting, Speleology subspecies.

The dynamic development of the tourism industry in the country requires all groups of tourism resources. Even at high attractive properties of natural resources without a communication, communications, municipal infrastructure, educational institutions, cultural monuments, art and more tourist activity to a wide range of customers is not possible. In these circumstances, despite its social and humane role tourism impact on the environment. Reducing the influence of the tourism industry on the environment is regulated at the national and international levels through:

- a) environmental education;
- b) restricting recreational and tourist pressure on natural resources;

c) tax regulations.

Territorial structure TRC determined by a combination of tourist and recreational items, centers, nodes, districts and zones formed or shaped by a variety of factors. However, the territory of Ukraine is a heterogeneous regions in a historical context and in terms of socio-economic development. They differ in natural conditions, ethnic composition of the population, settlement systems, tension ecological situation, economic potential, system of interregional relations, etc., resulting in a corresponding formed divisions of labor. All these factors are reflected in economic zoning.

1) the share of tourism and recreation industry in GDP, GRP countries (including the performance of the licensed business tourism, spa complex, hotels and other establishments of short - and long-term accommodation);

2) the share of tourism and recreation in total goods and services over time;

3) component structure of the tourism sector;

4) the number and quality of jobs in the sector;

5) comparison of revenues from international tourism to the export of goods and services;

6) the balance of income and expenditure on international tourism.

Statistical measurement of TRC state carried on the following parameters:

a) the number of visitors in the country / region;

b) their distribution by month / season;

c) the country of origin of tourists and their share in the total number of visits;

d) the dynamics of tourism flows for several years;

d) Expenditures in absolute volume and their distribution by various articles (housing, transportation, shopping, food);

e) the mode of transport and the type of housing used;

h) purpose of visiting; g) the sociological and demographic characteristics of visitors;

i) satisfaction of tourists traveling to the results.

This placement tourist and recreational facilities provides additional benefits host communities and regions including tourists using certain resources (unpolluted air, solar heat, beaches, hot water) with minor economic costs, provide financial revenues recreational facilities and local budgets due to the specifics of recreational consumption and its form of payment, accelerate the investment process in almost all sectors, implementation of structural changes in favor of services and product ment commodities, diversification and improving the quality of products and services that have a positive impact on the labor market (detailed by the author in previous works.

So you can show that the TRC, unlike other economic activities, is extremely sensitive to fluctuations in environmental performance and environmental situation in the region, precisely because trend analysis requires a long period, which eliminates the impact of temporary factors on key performance indicators. As the TRC has a distinctly seasonal, for making suggestions and directions of further development is necessary to determine peak periods, ensuring the maximum number of visitors and periods with a minimum number of visitors. The number of visitors - one of the basic indicators that are the basis for calculating the total volume of services provided, the average length of stay, the volume of consumer spending, the revenues of tourism and recreational facilities

Ukraine occupies a leading position in Europe in terms of providing natural and man-made tourist and recreational resources that could potentially generate significant interest of local and foreign tourists. The development of tourism and recreation industry in recent years in the country as a whole is

characterized by positive dynamics, increase in domestic and inbound tourism flows.

The structure of tourist flows in Ukraine is positive and shows significant prevalence of domestic and inbound tourism, which formed a total of 88.4% of all tourists. Thus, tourism and recreation industry in the country ensures the implementation of its main functions - creation of new jobs (including for vulnerable groups), increase incomes, increase revenue, reduce social tension in tourist and recreation areas, promotion of related industries, investment activity in the industry to develop new tourism products and improve the quality of existing service offerings.

The presence of recreational and competitive travel products and services will satisfy the relevant requirements of the population of Ukraine, foreign citizens, increase the investment attractiveness of the recreational and tourist areas of the country to strengthen its image as a recreational and tourist center of international importance . Therefore, the gradual provision of recreation and tourism modern scientific and methodological support and highly qualified personnel will significantly enhance its profitability by increasing the number of entities, the volume of domestic and foreign tourist flows. The author explains the fact that the demand for recreation in nature all the world is growing rapidly, increasing non-defined habitat of modern man's physiological and psychological needs. For example, economic and statistical analysis of the World Tourism Organization shows that recent international travel and the income from them increased in all regions of the world (tab. 3.3). So, for 48 years (1958 to 2006) the number of tourists in the world increased 15.2 times and revenue from tourism increased by 133.6 times.

Source: * systematized and summarized her authors set forth the results of the study and analysis of statistical data.

Ukraine has a favorable geographical and geopolitical location, unique natural and climatic resources, historical and cultural heritage. Among health resources we note significant reserves of therapeutic muds, which are almost all genetic types. In Ukraine, widespread and numerous mineral water spa of all types. Hydro resources widely and effectively used in the resorts of Transcarpathia, Lviv, Poltava, Vinnitsa, Ternopil and other areas. Healing climate coast of the Black Sea and Azov Sea, Crimea, Carpathians, middle zone countries are widely used as the basic medical and health factor in almost all resorts.

Unique natural healing resources are the mines microclimate (Solotvyno salt mines).

So Witness: TRK Ukraine is a powerful socio-economic and political factor in the economy and politics of many countries and regions. In particular, Ukraine has great recreational resources that are used or could be used for recreation, tourism, medical treatment, rehabilitation population [26]. Changes in both material and technical base and organization of production and the social sphere of modern society is certainly affected the socio-economic role of recreation in the process of social reconstruction. Today, recreation affects not only the recovery of the labor force, but on the whole person. For the current stage of social development characterized recreation increasing role in the process of recuperation rights. It TRC and is the complex system in which the intertwined interests of many sectors of the economy, culture, safety, employment, development of tourist infrastructure, recreation rehabilitation. The most cultivation, development and improvement of the structure of recreational facilities is celebrated Black Sea region within which recreation is the leading sector of specialization. Favorable climatic conditions of the Black Sea area, numerous beaches, warm sea, curative mud and mineral water for various types define its national and international importance.

In the Odessa region are 43 and resorts to treatment, 16 boarding houses and rest, hostels and camps. All are in the Odessa recreation area. Leisure as a social phenomenon and its place in the social sphere and environmental effects are not well understood by modern science. In this regard, studies in rekrealohiyi find opportunities to use and develop the resource potential of the Black Sea.

Tourism and recreation industry Zakarpattya past five years for all dynamic parameters, is active in investment activity, the number of visitors increased employment in the

industry is actively developing green tourism, which is based on the performance of individual households. TRK this region represented mainly small and medium businesses. In recent years dramatically changed the structure of the form of ownership in favor of private schools. The region is gradually emerging tourist and recreational complex with two well-defined peak seasons - summer (recreation, rest, treatment) and winter (ski), each of which has certain characteristics provide services.

The dynamics of organized tourism flows in 2008 is steadily increasing, the structure of tourist flows dominated by domestic tourism, which is a positive development in terms of the impact on regional development, because it creates additional demand for accommodation facilities, food, transportation, travel , enhances the range of services and products of the tourism destination, increasing employment, increasing incomes of local and state budgets, stimulate investment in the sector.

The main branch of outdoor activities - hiking, which is the largest center of Lviv - a large railway, highway and air transport hub of international importance. Among other distinguished Pustomiti, Vynnyky Shchyrets, Obroshino, Old Village, Zvenigorod. Big resort of national importance is great Lubin. For the recovery is most suitable southeastern slopes and narrow band wasted Davydov strands. The main health centers in the region are Bryukhovychi Vynnyky, mineral Tags, David, Suhovolya, Glynn Navariya. Speaking significant segment of services, TRC also relates to the field of intensive natural resources. Therefore, confirm that the state policy in the sphere of nature, including recreation and tourism, in a fairly active should regulate the development of recreation and tourism,

It is equally important to consider that anthropogenic pollution of natural resources and RTRK brings significant

economic and social damage. [41] Unfavorable environmental conditions affect the performance of social development of the population throughout Ukraine as reducing the recreational potential of natural resources, unfavorable epidemiological situation and environmentally innovative food negatively affect the health of the population of Ukraine and its workforce. General health of the recipient pollution are aggregated indicator of blahopoluchnist any region in ecological terms. According to experts of the World Health Organization defined health status by about 50.0% lifestyle by 20.0% - environmental conditions and climatic factors, 20.0% - heredity and only 10 0% - health measures [105]. Note that in Ukraine today there is a trend of significant growth in the number of tourists visiting Ukraine for treatment to the overall reduction of their number [37]. These data confirm that demand for rehabilitation is growing rapidly, and thus increasing the demand for natural recreation resources. It follows the extraordinary relevance of their conservation, management and restoration, because their quality is the primary requirement for tourists and travelers. The need to preserve and further revival of natural resources and protection of recreational and tourist areas is relevant also in connection with the demographic situation in the country - the population of Ukraine continues to decline. in Ukraine today there is a trend of significant growth in the number of tourists visiting Ukraine for treatment to the overall reduction of their number [37]. It should be noted that the preparation for holding in Ukraine European Football Championship in 2012 (hereinafter - Euro 2012) was a significant impetus for the development of tourism. Accessible natural and cultural and lessons in preparation for the football championship Ukraine infrastructural capacity brings a new level of recreation and tourism industry. The main achievements of the preparatory process of the tourism industry for Euro 2012 is the reconstruction of airports, railway stations and transport sector, substantial building hotels and tourist accommodation alternative means, the emergence of street marking tourism and urban development and advertising information providing tourism and hospitality industry.

One of the main preconditions for the development of hotel industry in Ukraine is the creation of a favorable investment climate and finding sources of financing for the construction of new and reconstruction of existing enterprises. Following the results of 2012. in new construction and technical upgrading of existing hotels and other places for temporary residence from all sources of funding invested 2579,4mln USD, representing 89.7% of 2013. The share of investments in the development of hotels and other places for temporary residence, developed in total investment was 1.1%. Among the regions of highest growth investments in the hotel industry Rivne (in 5.8 times more than in 2013) and Nicholas (2.4 times more) regions. In 2016. in Ukraine built 57 new hotels 2409mists. (Tab. 3.5).

Table 3.5

Source: State Statistics Committee of Ukraine *, 2016.

According to the functional structure of the hotel industry enterprises in Ukraine, services for temporary accommodation in 2016. provided 838 hotels, 25 motels 5 hotel-office centers, 8 campsites, 50 youth hostels and mountain refuges, hostels for 189 visitors and 480 other places for temporary residence. At the same time there was a decline of hotels compared to 2013 in the Sumy region. - 6 units, Dnipropetrovsk - 5, Vinnytsya and Zaporizhya - by 2 units each, Rivne - 1 hotel. Reducing the number of hotels was mainly due to their complete elimination, sale or transfer individuals to rebuild housing.

In Ukraine, most hotels are located in the city. Kyiv (9.8% of the total number of hotels), Lviv (8.9%) and Dnipropetrovsk (7.0%) regions, Odessa (5.7%), Luhansk (5.2%) and Chernihiv (4.6%) regions, due to their high level of industrial development, the presence of centers of tourist flows / spa area.

Admittedly, the index of the hotels determined by the number of hotel rooms per 1,000 inhabitants. For Ukraine this figure in 2016 remained at the level of 2011 and amounted to 1.6 hotel rooms per 1,000 inhabitants, in hotel rooms Kyyevu- 4.5 against 4.4 in 2013 more than the average for Ukraine was the availability of hotels 1,000 inhabitants; in Zakarpattia, Lviv, Odesa, Volyn and Ivano-Frankivsk regions indicator of hotel rooms fluctuated slightly compared to 2013 and ranged from 2.5 to 1.7 hotel rooms.

Minimum use of the capacity of hotels was in Kirovograd (0.18), Donetsk (0.19) and Ivano-Frankivsk (0,19) regions, while the maximum - in the city. Kyiv (0.50) ..

The decrease has taken place in most regions of Ukraine. Compared to 2013 total time visitors reduced rates m. Kyiv - to 465.9 thousand. Man-days Dnipropetrovsk region. - to 153.8 thousand. Man-days, Volyn - to 148.7 thousand. Man-days Chernihiv - to 95.7 thousand. Man-days and Odessa region. - to 93.1 thousand. Man-days.

Thus, despite wide "geography" of tourists who come to our country (in 2016 foreigners came to Ukraine from 218 countries to 205 countries in 2013), a third of their number (33.7%) were tourists from the States CIS - 339,3 thousand. people (Belarus - 48.5 thousand. people of Moldova - 17.9 thousand. people). For other countries, Ukraine is often visited by tourists from Germany - 81.9 thousand. People, Poland - 74.7 thousand. People, US - 67.0 thousand. People in Italy - 33.5 thousand. People, France - 32, 7 th. persons Turkey - 29.0

thousand. people, United Kingdom - 26.9 thousand. people, Austria - 21.1 thousand. people, Netherlands - 17.8 thousand. people, Czech Republic - 14.5 thousand. people in Canada - 13.9 thousand. people and Sweden - 13.2 thousand. people.

One of the most important characteristics as the hotel industry is also a comfort. The criteria for admission to certain categories of hotels is the quality common areas and rooms, availability of bathrooms and shower rooms, standard furnishings, types, quantity and quality of technical equipment, the level of processing facilities, the number and qualifications of staff; the level and range of services in nutrition. According to the national standard ISO 4269: 2003 "Touristic services. Classification of hotels" expected distribution of hotels and motels in five categories (from one to five "stars"). Today, according to standardization in Ukraine there are six five-star hotels, "Premier Palace", "Kyiv Sophia" and "Opera (Intern)" in the city. Kiev, "Donbass Palace" in Donetsk, " from 15.09.1995, which determined the general legal, regulatory, institutional and socio-economic principles of formation and implementation of modern Ukraine's state policy in this area in the context of solving problems to ensure the transition regions of the country to sustainable development. At the same time recognize that is not yet developed and adapted in practice, not economic levers and controls their implementation in the context of sustainable development of the regions of the state.

3.4. Improving the socio-economic impact of tourism and recreation areas

The fundamental basis for ensuring and improving the efficiency of social sphere of recreation and tourism has become a state policy, focused on achieving important social goals and priorities. That the state should establish and define

the overall strategy development, policy implementation and its precise mode of promoting economic recovery and recreation industry. It is a favorable market environment for socially efficient, economically viable and environmentally acceptable development of recreational and tourism business should direct public policy.

Summarizing all possible policy options regarding recreation and tourism, there are two main types of [64]:

first - recreation, staying within sight of government and representative bodies, developing as a secondary field of activity, behind other sectors;

second - Recreation priority area recognized as a promising socio-economic development of clearly defined regarding its policies and program of action. It takes place adequately at all levels of management, through various forms of assistance to stimulate entrepreneurial activity in the field of recreation and tourism, attracting investment, including foreign ones. This recreation is considered in the broader context of development, significant social and economic targets which can be achieved by ensuring a proper level of infrastructure, training, environmental safety. In this case, it would give impetus to a kind of practical actions in other fields directly related to it are not.

We support scientific opinion [64], which is the second option should be a strategic line of public policy development of recreation and tourism in Ukraine. Recreation and tourism can be an important basis for sustainable human development, because it is having a strong social impact, significantly strengthened the appropriate public policy meets important social needs and achieve social outcomes. And these fundamental provisions should be the basis of the approach to understanding the role of recreation and tourism and areas of development [119]. State policy should be directed to the formation of such a market environment, institutional,

economic and legal conditions which would promote business development in this area,

Recreation and tourism for the time of its existence became inaccessible to rest in the industry of public entertainment and recreation for people of different levels all over the world. International tourism has become part of the economic and social development and one of the most characteristic manifestations of globalization [122, 123, 124]. Modern tourism and recreation is one of the most profitable activities of the world economy, dynamically developing. According to the World Tourism Organization and the International Monetary Fund, tourism from the late 90's of the last century came in first place and holds a leading position in world exports of goods and services, ahead of the automotive industry, chemicals, food and other industries .

Average growth rate of tourism are 7-9% per year, significantly higher than the average annual rise of the global economy. The scope of recreation and tourism distinguish the following factors: a small initial investment; short payback period and very high profitability of projects; growing demand for services. This successful development of tourism in the world due to socio-economic benefit derived by the development of domestic and inbound tourism, which:

- create jobs in tourism and adjacent areas (each tourist who enters the country, creating jobs 8-10);
- activates the development of hotel and spa management, transport and catering business, excursion and information services, tourism and entertainment, sports and recreational facilities and business centers;
- contributes to the inflow of foreign currency;
- encourage investment in the local tourism industry, ie increasing budget revenues;
- activates the upgrading of local infrastructure of transport, communications, etc;

- contributes to the preservation and restoration of historical and cultural and natural heritage of the country, regions, cities and towns;
- supports the revival and development of traditional folk arts and crafts, making souvenirs;
- ekooriyentovanomu promotes the productive use of land with no agricultural value, which saves natural flora over large areas, and demonstrates the importance of natural and cultural resources for economic and social well-being of society.

For many countries, international tourism has become the most profitable area of activity and the revenue from it - an important component of national budgets. Travel and tourism investment projects stimulate the development of the transport and hotel and tourism infrastructure (including airports, roads, ports, restoration of historical monuments, museums, development of natural protected areas), which increases the quality of life of the indigenous population and service tourists [29, 125, 126].

According to the report, the International Council of Travel and Tourism (World Travel and Tourism Council), in 2016 in this sector directly employed nearly 80 million people, or 2.9% of employment in the world economy and in adjacent areas of tourism - is about 225 million people (9% of the population of the planet) [125, c. 300]. By 2030 the number of tourist trips, according to experts UNWTO may increase compared to the current period three times [127, c. 35].

Our country is not yet among the world leaders in the number of visits by tourists. However, the features of its geographical location and topography, the climate, the wealth of natural resources, historical and cultural tourist and recreational potential of creating opportunities for many types of intensive development and domestic and foreign tourism. Currently, the recreation and tourism Ukraine there are 8.5

thousand. Companies, of which almost 3,9tys. - business tourism activities (licensing tour operators and travel agencies), more than 2.6 thousand. Hotels and similar accommodation facilities, about 2 thousand. sanatorium and health institutions [74, p. 458; 85, p.5].

Enhancing the role and socio-economic impact of recreation and tourism should be the focus of public policy, implemented at different levels - macroeconomic, regional and local. Achieving social objectives of public policy has its own specifics, objectives, instruments and indicators at each level.

At the macroeconomic level conceptually important development strategy for the development of public recreation and tourism, which clearly formulates key socially important objectives and mechanisms to achieve them. At the meso level (regional level) declared goals and objectives specified based on the existing climatic resources and the existing infrastructure. Quite often happens in the world of asymmetric development of the various regions. For example, in Turkey coastal tourist regions highly and distant mountains are backward and unattractive to tourists with weak social protection and insufficient infrastructure.

Directly providing recreation and tourism services performed on micro issues that actualizes the definition of tourist destinations. Here are the available accommodations, meals, entertainment, provided a certain level of quality of services available transport, information, communication system.

Definition tourist destination indicates that it is "a physical space in which a visitor spends at least one night. It includes such tourist products as support services and attractions, and tourist resources Visiting along the road" back and forth "in less than one day. It has physical and administrative boundaries that define the shape of its

management, and image and reputation, which determine its competitiveness in the market "[29, p. 65].

The implementation of socially oriented policy of recreation and tourism at the local level requires the establishment of specific goals and corresponding indicators. In world practice has worked out development tools, system of indicators to manage the tourism sector from the perspective of sustainable development of the territory. The principles of sustainable tourism related to the use and division of spheres of the natural, socio-economic and cultural environment [128].

Providing high socio-economic impact of recreation and tourism requires an integrated approach taking into account cross-cutting effects of its operation at all levels. Implementation of programs of recreation and tourism industry is only possible through continuous and careful monitoring. Only under such conditions it will develop effective and sustainable.

In the 1990s the world have begun to develop a system of indicators to optimize the functioning of the city (Spain), regional development indicators (Chile), international environmental indicators, human development index and so on. In the same period based on indicators developed the first model of tourism and recreation areas (Malta, south of Australia, etc.) [129].

The proposed indicators include traditional rules of recreation and tourism (eg, capacity assessment areas) and new criteria of sustainable development at different territorial levels. These developments 90s served as a major impetus for the development of indicators of sustainable development of recreation and tourism.

In 1995-1996. The first technique produced with the use of indicators of sustainable development of tourist destinations. They were tested in Canada, USA, Mexico, the Netherlands, Argentina and other countries. Under the auspices of the World

Tourism Organization held a series of meetings and seminars on the development and use of indicators [130]. According to the World Tourism Organization, the use of indicators of sustainable development of tourist destinations need to:

- adoption of optimal decisions about tourism development and reduce the risks of losses;
- prevent negative issues of tourism development in a particular area;
- identifying areas of tourism development;
- development of business plans and tourism development programs in the territory;
- risk reduction in the primary planning;
- increased responsibility for the development of tourism and involvement of the public;
- continuous improvement mechanisms for tourism development through regular monitoring of the state territory.

Thus, indicators of sustainable development of tourist destinations should be considered as the basis for the rise of tourism and at the same time as a tool for making decisions on priority directions of its development. Professionals working in tourism, always use indicators, some of which can be seen as related to sustainable development of tourist destinations.

The most simple of them is the amount of costs and revenues from tourism, the number of arrivals. However, the latter figure may be regarded as an indicator of sustainable tourism development only when it corresponds with the desired results and based on the determination of the maximum allowable capacity. Such phenomena as peak load, must be carefully evaluated, because it is not only the problem of using the number of rooms, but also excessive resource consumption (eg, fresh water).

Indicators can play the role of a certain degree of tension signals that allow respond to changing situations, criteria for assessing risk. Indicators for sustainable

development of tourism destinations associated with the analysis of the impact of external and internal factors that determine the development of tourism. The main purpose - to analyze the risks for the latest business travel and study area as a whole.

There are several types of indicators:

Prevention - indicators that reflect certain trends and warn of changes taking place in the "tourism - society - nature". These include, for example, are indicators of decline in the number of arrivals, length of stay of tourists in the territory of others;

tension - tension indicators functioning of this system and the presence of hidden conflicts as a result of using the tourist area (including water resources in the territory as a result of recreational and tourist development, rising crime on the territory).

measures - indicators that require definition: the current level of development of recreation and tourism and its place in the economic structure; measure the impact of recreational and tourism activities on the natural, socio-economic and cultural environment (for example, increasing the share of revenues from the development of recreational and tourism activities involved in recreation and tourism sector, changes in forested areas or areas of land used for recreational and tourism purposes etc); measure of management effectiveness recreation and tourism and the area in general (eg, evaluation of the current level of the ecological situation in the territory, evaluation of health of coastal and beach areas, increasing the number of regular tourists, lengthening the duration of stay in the territory, etc.).

Indicators can be qualitative and quantitative expression; but on certain indicators may not be comparable. For example, the number of arrivals can be measured in thousands of millions per unit time (per year). Value of

domestic and international tourists expressed as a percentage, and temporary units are month, season and so on. The proportion may be considered as a measure of the current state compared to reference values earlier data, etc. [131, p. 188; 132].

Particular difficulty during specific indicators and their comparison are qualitative indicators. For example, indicators that characterize the extent of satisfaction of tourists and tourists of their stay in a certain area, performance quality indicators adopted programs for tourism development. Development of sustainable tourism indicators - a complex and multi-step process (ext. S).

Basic methods of development indicators are in the gradual implementation. The final stage involves the formation of a final list of indicators used for the study area and planning of tourism therein. Let us examine some of the most difficult stages of the development of indicators of sustainable development and planning of tourism in the area. At the initial stage - research and organization - collected primary information about the area, analyzes the current state of tourism development on it. The question of boundaries tourist destination is ambiguous. It often contradict the political, administrative, natural limits to the principle of maximum assignment.

According to experts of the World Tourism Organization, tourist destination to be attributed to all areas and sites somehow related to the development of tourism. For example, you should consider the areas, where employed in the tourism sector workforce. In addition, the territory should be based on ecological boundaries. Of particular importance during territory borders with the so-called key areas that have a significant impact on the whole territory [130]. Thus, national parks, or therapeutic bathing-beach tourism and recreational

centers spread its sphere of influence considerable territorial space [133, 134].

The main objective of phase - to formulate specific goals and objectives for tourism development in the territory and determine its place in the economic sector. Initially determined desired indicators analyzed source of information is the collection of data and their initial analysis of the proposed indicators (as informed by public authorities and investors), then assessed the effectiveness of selected indicators and conducted their audit.

International experience demonstrates the feasibility of attracting as experts from different public and social sectors. For example, in Norway, in the planning and management of tourism development were involved: representatives of various public (social) groups (local NGOs, indigenous (ethnic) peoples); government agencies at the municipal, regional and national level; NGOs (environmental organizations and organizations concerned with the preservation of cultural and natural heritage, sports organizations, fishing, etc.); tourists, organizations representing the interests of domestic tourists; international tourist organizations and associations.

The choice of indicators of sustainable development of tourist destinations depends on the specific project objectives, priority areas of the territory. The initial list of desirable indicators is usually different from the final. The task of those involved in tourism management and planning of its development in a particular area is to reduce the number of indicators, leaving only the most relevant data and information provided. Thus, the initial list of indicators on the islands of Samoa includes 270 positions and only after careful selection it was reduced to 20 [135].

Number of indicators and their composition may vary as depending on the specific area, and the purpose of the study. Thus, the development of eco-tourism on the coast of

Argentina, it was important to assess the whales in the Gulf, while the bathing-beach holiday - the nature of the coastline and the availability of natural beaches.

It should be noted that in some cases it is advisable to use indicators that can not be provided with accurate data, but reflect the seriousness of the problem. For example, monitoring water quality in coastal waters can be performed using not only the exact data of environmental services, but alternative indicators (number and nature of cases of skin irritation due swimming complaints to the state beach area, jellyfish off the coast, etc.). In this case, the use of such indicators is a catalyst (incentive) for additional research and find solutions to problematic situations.

Indicators of sustainable development of tourist destinations used at different levels - from local to global. For combination requires political part of the solution. In determining the strategic objectives of the region, namely the tourism industry should proceed to study the capacity threshold systems - natural, social, economic and cultural. In the tourism development area number and role of indicators may vary. Therefore, the development of indicators of sustainable development of tourist destinations and needs constant updating relevant databases. In the development may vary and primary objectives laid at the planning stage. Thus, the current needs of tourists forced to develop and make the market a differentiated product for which must be the material base.

To further study the conceptual aspects of improving the social impact of the operation of recreation and tourism should conduct a multifaceted diagnosis. It will be based on a range of factors that have a significant impact on the strategy of the study area (Table 3.1). This analysis is called REST-analysis, which is the instrument of strategic analysis far environmental organization [136, 137].

Table 3.1

REST-analysis environment of recreation and tourism *

* Source: [136, 137].

It is designed to detect Policy (Policy), economic (Economy), social (Society) and technology (Technology) aspects of the environment that may affect the strategy of development of recreation and tourism. The analysis of the political environment is important because it defines the general conditions of stability and security of the region or the entire country. The economic environment should be conducive to the implementation of various economic activities. Equally

important social characteristics of the population, which determine its readiness and ability to relax. Technology is an important component in the context of readiness for change in the region and meet modern technology requirements.

REST thorough analysis will help formulate more precise goals of recreation and tourism at national, regional and local levels. It is important that it was guided by social goals: the preservation and enhancement of moral and spiritual values of humanity, health, reproduction and ensuring conditions for preserving the environment. The development strategy of the tourism industry must focus on the protection of cultural and historical heritage, fight against poverty, the effects of climate change, prevent further climate change and environmental degradation, reduce the negative impact on it [138, 139].

The strategy of recreation and tourism should be considered:

- achieve European and global parameters value service quality and prices are based on systematic measures for standardization of service quality and economic incentives for companies to improve their;
- quickest possible adaptation of normative legal acts and legislative sphere of recreation and tourism to the standards adopted in the European Union;
- attracting foreign investment for infrastructure to service the recreational and tourist flows;
- transport, trade, communications, manufacturing products for use in the resort and recreational and tourist activities and services;
- creating an attractive tourist image of the region and promote regional tourism products to national and international tourism market;
- Development of logistics and infrastructure for recreation and tourism (modernization of bringing to the

international standards of logistics sanatorium existing health institutions and facilities of the tourism industry);

- commissioning of newly built recreational facilities through the development of economic mechanism to stimulate investment in this area;

- comprehensive approach to improving the quality of reception of tourists and travelers and service;

- bringing to the norms and standards of international hotel classification, certification host of other structures;

- bringing to the international organization and its restaurant business service;

- expanding the quantity and quality of recreational and tourism services provided;

- participate in the regional and European salons and fairs;

- organization of tours that will allow the best view offered products and evaluate the quality of reception;

- marketing execution system market recreation and tourism;

- creating favorable conditions for investment, tax and customs regulations of local, regional and national development;

- rational use and protection of recreational and tourism resources, creating programs and planning the future prospects of recreational and tourist regions in particular and the state in general [140, 141].

Strategy development of recreation and tourism can be defined as a set of solutions (system measures a set of programs) designed to study perspectives, priorities and areas of recreation and tourism, development and effective use of capacity, ensuring its dynamic and sustainable development. The strategy should combine the interests and activities of society, the government and the business sector to address prospective economic problems.

Conceptual framework strategy development areas recreation and tourism should include establishing primary objective and its components (sub) based on social, economic and environmental priority. Achieving the main objective - the transformation of areas of recreation and tourism into a powerful competitive sector of the national economy - should take place simultaneously with the achievement of environmental and sustainable human development. Only in such mutual unity and based on a highly developed infrastructure, this sector can be a powerful factor in GDP growth, employment and most importantly, improve all parameters of human development in the country [142, 143, p. 20-21].

Implementing this strategy through the establishment of a single governing body of recreation and tourism with the function of monitoring and coordination to ensure the management and socio-environmental and economic development sectors. At the initiative of a single governing body developed by national, regional and local development strategies of recreation and tourism [144, 145, 146].

Implementation of these tasks can be provided a set of the following measures:

organizational: Organization full statistical records of inbound and outbound tourism in a single governing body, its structural orientation; organization of regional and local tourist information centers for the purpose of information and analytical activities to identify priority objectives and targets of marketing policy, reservation services within the region and beyond, transportation, hotel, theater and exhibition tickets; stimulating the creation of new companies and the development of new tourism products;

investment policy authorities in the field of tourism: Attracting external capital loan secured by real estate and thus ensure investment in new facilities the hotel industry; allocation

of tax payments by enterprises hotel, the local budget as a guarantee fund providing loans to investment projects of hotel; direct involvement of foreign capital into the development of the hotel industry (training programs address new hotel construction, based on the analysis of objects that were hotels in the past, the possibility and expediency of their return in this area, preparation of regulations to ensure the legalization of targeted programs and mechanisms its implementation);

- *rekonstruktsiya and reorganization of the existing hotel stock, preparation of new hotel construction*. An analysis of loading hotels and forecast future demand, new construction is critical because even bringing international requirements around the hotel stock can not meet the growing demand;

- *infrastructure*: Organizational and financial support for local action for tourism; providing advertising and marketing activities in order to create an attractive image of the region; preparation of investment proposals feasibility study on the tourism sector and their advertising and information security; providing expert investment proposals region and technical assistance projects; financing of specific projects aimed at developing tourism and cultural sites in the region; development programs of industrial infrastructure hotel industry, including the production of goods dribnofasovanoyi products for hotels, development of processing capacity in regional farms to produce food products for hotels; analysis of the major tourist destinations, the development on this basis targeted program of restaurants, cafes and related facilities (souvenir shops, currency exchange, information kiosks); development program of transport companies that provide transportation of tourists; development measures (tax, administrative, etc.) to ensure the priority of the market of certified products and services.

In most countries tourism policy is conducted in the framework of regional economic development and is aimed at

revitalizing the economy of the backward areas. As for developed countries, it is stimulating the development of tourism in the region is carried out by injecting capital into them and create centers of economic growth [147].

In our view, the government strategy of recreation and tourism in Ukraine should be based on continuous improvement of management of this area at all levels and clear orientation to achieve important social objectives: increase coverage of population and certain categories of recreational and tourist facilities, improving service quality, preservation socially protected segments of consumers, improvements in health and quality of life of the population as a whole.

SECTION 4

IMPROVING sustainable development strategy recreation and tourism in UKRAINE

4.1. The essence and importance of sustainable development recreation and tourism

Sustainable tourism is based on the doctrine of sustainable development, which aims to replace the relationship between man and nature to expand opportunities for economic growth and the creation of a coordinated global strategy of survival, focusing on conservation and restoration of natural communities on the scale necessary to return to the limits of economic capacity of the biosphere. The doctrine constitutes a set of ideas, policies and tenets of various sciences, which formed the basis of UN documents as the "agenda for the XXI century", Convention on climate change, combating poverty and others. Sustainable development involves the economic, social and environmental problems. Development will be

sustainable only if equilibrium is reached between the various factors that contribute to overall quality of life.

1. Restoration and continuance in the right amount and necessary area of natural ecosystems and their ability to reproduce.

2. Providing while advancing the solution of problems: economic, social, demographic and spiritual development.

3. Harmonization in the economic development of the economic capacity of ecosystems.

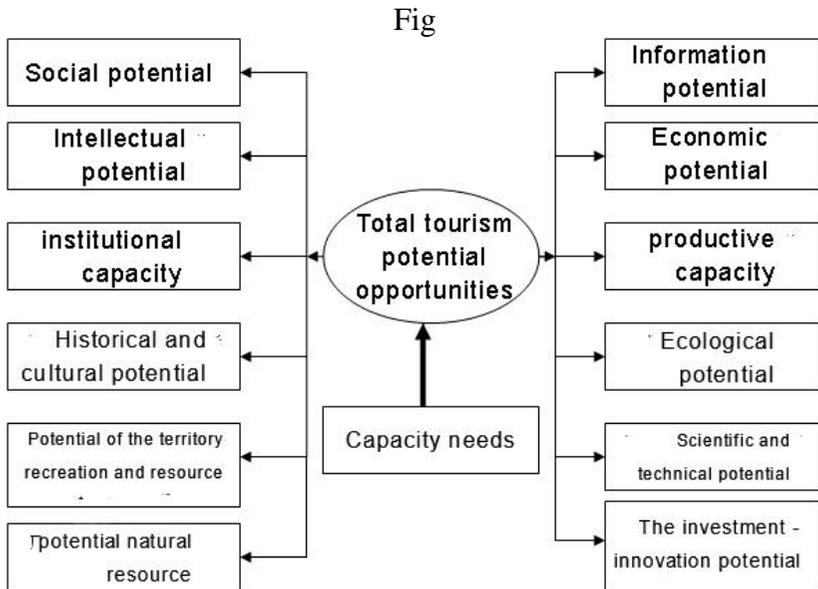

At the heart of the Doctrine of sustainable development is the concept of sustainable development, based on principles: sustainability of development processes, harmony of human development and social justice. The set of sustainable development indicators characteristic defines quantitative and qualitative parameters and forms of scientific and theoretical background for harmonious economic development of national and world economy. As defined by the UN key indicators can be grouped into 14 chapters: poverty, governance, health, education, demography, natural disasters, atmosphere, land, sea water, fresh water, biorizmayittya, economic development, global economic cooperation, consumption and production [2]. The sustainability of tourism development is a component of national economies. Tourism as a sector of the economy is in a complex interaction with the environment and so today, the task of further development of tourism is to reduce the negative environmental impact (pollution from sewage, waste, emissions of air transport, erosion of beaches due to alignment of the coastal area, the impact on the culture of local residents, loss of historical and architectural heritage, employment of minors, etc.). Governments must be adopted restrictions and regulations to minimize these negative effects. Tourism should be developed so as to benefit the local population, strengthen the economy of the host country, creating new jobs. Tourism industry has great potential, which allows you to make a

constructive contribution to the sustainable development of countries and regions, the task of further development of tourism is to reduce the negative environmental impact (pollution from sewage, waste, emissions of air transport, erosion of beaches due to alignment of the coastal area, the impact on the culture of local residents, loss of historical and architectural heritage, employment of minors, etc.). Governments must be adopted restrictions and regulations to minimize these negative effects. Tourism should be developed so as to benefit the local population, strengthen the economy of the host country, creating new jobs. Tourism industry has great potential, which allows you to make a constructive contribution to the sustainable development of countries and regions, the task of further development of tourism is to reduce the negative environmental impact (pollution from sewage, waste, emissions of air transport, erosion of beaches due to alignment of the coastal area, the impact on the culture of local residents, loss of historical and architectural heritage, employment of minors, etc.). Governments must be adopted restrictions and regulations to minimize these negative effects. Tourism should be developed so as to benefit the local population, strengthen the economy of the host country, creating new jobs. Tourism industry has great potential, which allows you to make a constructive contribution to the sustainable development of countries and regions, erosion of beaches due to alignment of

the coastal area, the impact on the culture of local residents, loss of historical and architectural heritage, employment of minors, etc.). Governments must be adopted restrictions and regulations to minimize these negative effects. Tourism should be developed so as to benefit the local population, strengthen the economy of the host country, creating new jobs. Tourism industry has great potential, which allows you to make a constructive contribution to the sustainable development of countries and regions, strengthen the economy of the host country, creating new jobs. Tourism industry has great potential, which allows you to make a constructive contribution to the sustainable development of countries and regions, strengthen the economy of the host country, creating new jobs. Tourism industry has great potential, which allows you to make a constructive contribution to the sustainable development of countries and regions,

In connection with this problem occurs methodological research potential regional links with the environment, the solution of which can promote the goal of improving management them for sustainable tourism. However, to date the problems of determining the relationships between different potentials and management of their properties has not been given sufficient attention.

Considering the structure of the potential of the region used in the field of tourism, should be allocated among them the key. Key capabilities include those forming and development which can provide sustainable operation and development of the region. These potentials are influenced by capacity needs, which dictates the degree of use of potential opportunities. The structure of total tourist potential of tourism development is shown in rys.4.1.

.4.1. The structure of total tourist potential of tourism

Presented in Figure 1 for regional potentials for tourism development is not complete, because their number depends on the goals, methods of and achieve the necessary resources. Exactly potential needs of the source and the driving force of tourism in the region, it should be focused all other potentials. Obviously, the central element that creates the overall capacity needs are turysty.Vykonanyy analysis of potential operation and development of tourism gives rise to present the region as the sum of its potential and identify the subjectmanagement tourism. In our view, the subject of tourism management properties is a potential connection between them directions for their use. Arguably, the potential of the region - a system concept. Sustainable tourism - is consciously supported the development, which is why the role of the state as soon as it is able to develop a strategic framework planning of the tourism industry. The feasibility of the transition to the implementation

of sustainable development strategies Ukraine defined as internal factors and external related to the European aspirations of Ukraine and the need for compliance with international obligations of Ukraine. Against the backdrop of increased competition in the international tourism market, global trends to strengthen the role of states in the sustainable development of tourism, national domestic tourism product becomes less attractive and competitive. As a result, the tourism and resorts in the state is unable to ensure the full implementation of economic, social and humanitarian functions, is not conducive to preservation of the environment and cultural heritage, create jobs, increase the share of services in the VVP. .Dlya overcome these negative phenomena in Ukraine designed by

At the heart of the Doctrine of sustainable development is the concept of sustainable development, based on principles: sustainability of development processes, harmony of human development and social justice. The strategic goal is to develop the concept prioritization of the industry that provides social and economic development of the region. Ways to achieve this

- research and evaluation of tourism potential of the region;

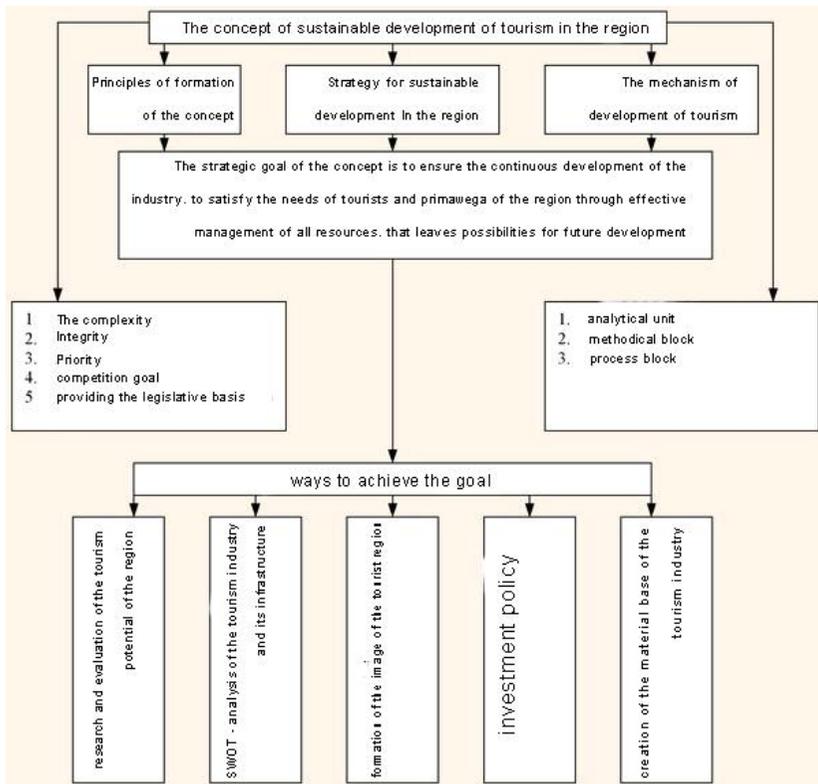

- SWOT-analysis of the tourism industry and its infrastructure;

- formation of tourist image of the region;

- innovation and investment policies;

- the creation of material base of the industry.

Key components of sustainable development of tourism in the region shown in Fig. 1. Based on studies on sustainable tourism development and learning experience of countries proposed a set of methodological principles and approaches to the structure and content of sustainable development of tourism in the region. These include: comprehensiveness and integrity priority, concrete objectives, security legal framework

Rys.4.2. The concept of sustainable tourism in the region

The principle of comprehensiveness and integrity of the concept of sustainable tourism in the region provides,

- higher than the average - Lviv, Mykolayiv and Sevastopol City.; average - Volyn, Transcarpathian, Zaporizhia, Dnipropetrovsk, Kyiv region and the city. Kyiv;
- lower than the average - Vinnytsia, Volyn, Donetsk, Zhytomyr, Ivano-Frankivsk, Luhansk, Poltava, Rivne, Sumy, Ternopil, Kharkiv, Cherkasy, Chernihiv region, which certainly confirms the existence of significant potential Therapeutic recreation and tourism;

- the lowest - Kirovohrad, Khmelnytsky, Chernivtsi regions.

Grouping regions of Ukraine by a combined index of recreation and tourism during the 2001-2016 biennium. Found that disparity varies only in the group of the highest and lowest level due to the annexation of the Crimea and the temporary occupation of the territories of Donetsk and Lugansk regions (see. Table. 2.6).

Thus, during the 2001-2016 biennium. Significantly reduced the number of objects, especially health centers (specialized accommodation facilities) - from 3304 to 1928 (by 41.6%). And not only decrease occurred in 2016 (31.8%). This trend is inherent throughout the study period, indicating a deterioration in the health of the population. Proof of this is the reduction ratios and if 2001 10 thousand. Population was 0.7 establishments of this type, the year 2016 - only 0.4. Unfortunately, we must note that the development of recreation and tourism in Ukraine is characterized by a generally negative trends (tab. 2.7).

Table 2.7

Indicators of social performance objects and subjects recreation and tourism Ukraine, 2001-2016rr. *

Indicator	2001	2005	2014	2015	2016	2016 to 2015,%

Source: [98, 73, 85].

At the same time the positive trends observed increase in the number of such establishments as hotels and similar accommodation facilities for them, as well as subjects of tourism - respectively from 2682 to 3885 and from 0.6 to 0.9 establishments per 10 thousand. Population.

Also descending character with coverage indicators rehabilitation services and recreation. Yes, most reduction was served on the size / recovered in sanatoriums - from 3012 to 1610 thousand. People (46.5%), including against 2015 - by 43.2%. If 2001 10 thousand. People improved their health in sanatoriums 622 people, the year 2016 - only 375 people.

The number of persons served hotels and business tourism, in general grew steadily until 2015, and in 2016 - declined. Overall, the number of people served in hotels increased from 3 497 to 3 814 thousand. (9.1%), including 10 thousand. People population - from 722 to 888. The subjects of tourism services provided in 2001 p. 2175 thousand. people, whereas in 2016. - 2 425 thousand. The number served by 10 thousand. Population respectively increased from 449 to 565 people.

Noting the generally positive trend of the operation of hotels and business tourism, it should be noted that these institutions provide services mostly for a fee. Therefore, to attribute them to the characteristics and components of the process of human development is possible only if the increase in the coverage of these services accompanied by rising personal income.

The social aspects of recreation and tourism areas, as noted above, and include employment rates, which are characterized by negative trends (see. Table. 2.7). For example, in health centers reduce the average number of full-time employees amounted to 57.9% (relative to 2015 - 41.6%); rates - 15% in 2005 (29.6% in 2015); in tourist activity - increased

from 10 632 (2005 g.) to 11 513 (2016 g.), but compared to 2015 decreased by 15%.

In the recreation and tourism is concentrated great potential medical, administrative staff, support staff employed to maintain the recreational and tourist flow. In particular, in 2016 this sector employed 89.9 thousand. People (1.0% of the total average number of full-time employees - 9 mln.), Including of tourist activities (licensed travel agencies and tour operators) - 11.5 thousand. people (12.8% of total employment in the recreation and tourism sector), hotels and similar accommodation establishments - 26.6 thousand. (29.6%), spa and wellness facilities - 51.8 thousand. (57.6%). Number of employees (10.6 mln. People) compared to 2015 decreased in all economic activities, particularly in temporary accommodation and catering - by 8.2%, the arts, sports, entertainment and recreation - the lowest at 0.3%, reaching 269.9 thousand together. people (2.8% of total) [99, p. 13]. A considerable share of employment in the tourism and recreational facilities are highly qualified, with the average number of full-time employees in the tourism sector with higher and secondary special education 6.2 thousand. People (84.5%), health resorts and health centers employed 5.2% 14.6% of doctors and nursing staff [97, p. 11, 52-53; 85, p.5]. 2% of physicians and 14.6% of nursing staff [97, p. 11, 52-53; 85, p.5]. 2% of physicians and 14.6% of nursing staff [97, p. 11, 52-53; 85, p.5].

Thus, at the present stage of recreation and tourism Ukraine affected a large number of negative factors, such as: unstable political and economic situation, the imperfect management mechanism, worsening socio-economic situation, the loss of much of its potential as a result of annexation and military operations and more. Based on the analysis of the current state of tourism and recreation system, taking into

account macroeconomic and regional factors, the following features of their development:

- deterioration of social performance indicators functioning areas of recreation and tourism decline (especially in the last two years) level of coverage of different types of recreation and tourism;

- growing structural imbalance of the market recreation and tourism in the region, the loss of a large part of recreational and tourist potential of the area (the Crimea and Donbas);

- chronic underemployment objects recreation and tourism infrastructure and a significant depreciation of fixed assets of these companies lack the resources to improve the quality of services and investment.

In this situation, particularly actualized question of finding effective mechanisms of recreation and tourism as an important factor for economic and social development of the national economy of Ukraine. Our country has the potential for development of recreation and tourism and enhancing their impact on the social aspects of life: rest and recovery, increase intellectual capacity and cultural level of the whole person and - quality of life. However, it is important not so much the economic realization of this potential as enhance the social aspects of recreation and tourism areas, its role in sustainable human development.

2.3. Methodology for calculating the ecological and economic tourist load

The international community is increasingly concerned about the negative effect of tourism on the environment,

namely degradation of natural landscapes due to excessive consumption of resources; buildings lands; pollution of natural objects; threat to wildlife and the habitats of animals and birds; loss of biodiversity and, finally, a violation of local customs and communities and so on. Urgent scientific challenge in this area is the calculation of thresholds degradation of recreation areas on the number of visits. It takes into consideration the quality of soils (the sandy, loamy black soil to) the type and density of forest stands (steppe vegetation, coastal) and other factors for the temperate climate, the ability to determine recovery inflicted pressures. These values are individual for each recreational area and are experimentally. In the conditions of dynamically growing tourist flows, which over the past 60 years have increased 40 times (from 25 million in 1976 to more than 1 billion people in 2016), the tourist load on the world's recreational and tourist resources, which in some places the increased concentration of tourist traffic has already reached critical boundaries. Identify logistical capacity (maximum load) sea beach during summer vacation possible under sanitary norms length of beach per person (which is 0.2 meters). This is best formulas, which are listed below:

1. indicator provision coastline beaches:

$$\mathbf{Zn = Ln / Lzah,}$$

where Zn-availability of beaches (m / km);

Ln-length beach (km)

Lzah-coastline (km).

2. indicator single maximum capacity of the beach:

$$\mathbf{EP = Ln / CH}$$

EP-where maximum capacity single beach (pers.)

Ln-length beach (m);

CH-sanitary norms length of beach per person.
3. indicator degree of use of beach resources

$$\mathbf{Bn = Jer / EP}$$

where Vp-degree use of beach resources (%);
Jer-capacity recreation facilities (pers.)
EP-single maximum capacity of the beach (pers.).

4. Value of maximum (allowable) annual capacity of beach:

$$\mathbf{Yemr EP = T \cdot}$$

Where Yemr, the maximum possible (acceptable) annual capacity of the beach (pers.)

EP-single maximum capacity of the beach (pers.)

T-period with favorable climatic conditions (days).

5. Rate as possible (acceptable) turystopotoku (ie potential logistics beach):

$$\mathbf{PMR = Yemr / TST}$$

Where the LDP - the maximum possible annual turystopotik (pers.)

-The maximum annual capacity Yemr beach (pers.)

TST - Average Duration (days).

6. Opređenje daily capacity most famous and visited tourist sites that form the cultural and historical potential of the big city, which attracts tourists (C):

$$\mathbf{C = (C1 + C2 + C3 + ...) (1-Ir)}$$

where c1-capacity facility 1;

C2-capacity facility 2;

C3-capacity facility 3;

Ir - correction factor site visits by local residents and individual tourists.

To determine the daily throughput (logistic capacity) of the proposed technique developed by the author based on the

algorithm recommended by the UNWTO for architectural and historical exhibition of objects:

7. definition throughput capacity the facility:

$$P = Y / Z,$$

where P - the throughput capacity of the object (pers.)

T-object area (m²); Z - recommended standard density yet m² / tourist).

8. Determine the rate of rotation:

$$K_p = M / B$$

where K_p - coefficient of rotation;

M - number of hours per day when the facility is open to tourists (h.);

B Average Visit Duration (h. - min).

9. Determine the maximum allowable number of daily visitors (maximum daily flow of tourists - the logistic potential object):

$$Matthew \cdot P = K_p,$$

where Matthew - the maximum number of daily visitors (pers.)

P - throughput capacity of the object (pers.)

K_r - coefficient rotation.

As an example, the calculation of logistical capacity (ie maximum possible turys-topotoku) for tourist object-medieval castle area of 10,000 m² (t = 10000m²) and standard density rating Y = 5 m² / 1 tourist.

So, first determine carrying capacity of the object: P = 10000/5 = 2000 people. 10.Rozrahovuyemo rotation coefficient: K_p = 8 hours / 1 hour. 40 min. = 4.8.

Finally we get value logistics capacity fortress that is the maximum possible amount turystopotik

Matthew 4,8 · = 2000 = 9600 people. / Day.

Similar results in other climates can have an effect that is different from resulting in a temperate climate. The calculated thresholds environmental degradation can be used with a known approach to any region of Ukraine, which will enable the planning and creation of recreational areas expected to limit the flow of visitors, ie power recreational facilities. In the practice of tourism enterprises most widely following indicators.

Return on sales (Pp) is calculated as the volume sold in tourist products and services and their individual categories:

$$\mathbf{Pp = BP (PE) / VR (UR) * \underline{100\%} \text{ or } Pp = BP (PE) / C * 100\%}$$

where BP - balance profit;

PE - net profit;

In p (a p) - earnings (net revenue) from sales;

WITH - cost.

Unified methodology for determining the load on the environment there is not only in our country but also abroad. Modern authors use both terms of human pressure and throughput capacity, adequate or optimal load it [50, p.166]. The results of the analysis of methods of calculating ecological and economic burden of recreational methodological point of view it is advisable to calculate the capacity of the territory is not in size, but based on linear load (recreational trails capacity of areas for recreation). In particular, L. Kobanets gives the formula for determining the capacity of the controlled recreation area (Ecotourism recreational area):

$$(1.1)$$

where - the best of recreation, pers. / day;

- reclaimable factor considering violations of vegetation, soil compaction during laying and improvement of trails (from 1.5 to 2.0 for wide and narrow paths, respectively);
- the width of the trail and on-site and route of (typically 1.5-2.0 m);
- Length of segment of the route (between network nodes), m; n - number of sections of the network;
- the area that holds the j-th object display, point of rest, etc. m²; m - the number of objects the show, points of rest;
- normal distribution paths for tourists that prevents physical and psychological discomfort when passing route (depending on the curvature, the width of the path, the type of vegetation, wildlife, etc., should be determined in each case), pers. / M²;

T- the duration of the global day, hour .; t - the average length of stay in the recreational area. kWh / day [55, p. 102].

This is particularly important even distribution of tourists and travelers on the paths in the world by means of monitoring. To this end, taking a number of measures, including timely (possibly temporary) closure of congested areas and promote visits frolicking. Through management solutions can increase throughput, including by planning paths to a more widespread distribution of tourists and travelers the natural park; reducing conflicts between competing types (eg, selection of sites for special campsites, hotels and green stands for unorganized tourists); of advocacy; increase the strength of the resources are updated (for example, materials for road surface);

Thus, implementation of methodological linear approach to calculating recreational capacity of natural areas, along with the creation within the parks recreation and tourism enterprises of innovative type (year-round water park high bandwidth) and collection of rent for natural recreational

resources of enterprises will contribute to the sustainable development of recreational and tourist activities natural parks, improve the economic and environmental and social conditions in the regions. Determining the ecological and economic directions of development of recreational and tourist research in the social aspect, we should pay attention to the following: - forming concept of sustainable development of recreation and tourism at different territorial levels; -vyvchennya tourism and recreation as systematically organized phenomena, analysis of current trends in their development; -development and standardization comprehensive methodology for assessing the tourism potential of the territory at the national, regional and local levels; - scientific substantiation limits, models design and development of tourist-recreational special economic zones on the basis of permissible recreational loads; -development management mechanisms recreational zones on the basis of formation of the system of statistics, processing and analysis of data on tourism, development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. - scientific substantiation limits, models design and development of tourist-recreational special economic zones on the basis of permissible recreational loads; -development management mechanisms recreational zones on the basis of formation of the system of statistics, processing and analysis of data on tourism, development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. - scientific substantiation limits, models design and development of tourist-recreational special economic zones on the basis of permissible recreational loads; -development management mechanisms recreational zones on the basis of

formation of the system of statistics, processing and analysis of data on tourism, development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64]. development of information and reference and mapping software recreation and tourism activities; - drawing up short -, medium - and long-term forecasts of regional and local recreation and tourism markets on the basis of monitoring [57-64].

Let us consider what happens as a result of the tourism industry. The negative effects of tourism today in a country experiencing many of the developing countries, especially those that do not have sufficient technical and financial capacity to fill the resources spent by tourists and held them remove waste. No secret that such waste in its volume Often far exceed those generated in the daily activities of the total population, which is the subject of tourism. For example, in Nepal, where large popular this kind of outdoor activities like hiking, every tourist is estimated every day burns about 6 kg of wood, and despite the fact that the country has an acute shortage of fuel. In the Egyptian capital Cairo, a stately hotel for a year consumes as much electricity how much it spends 3,600 households belonging to middle-income Egyptians. In the Caribbean region, the demand for seafood from tourists is so high that a major factor was the increased burden on the population of lobsters and shellfish. The pursuit of "natural" building materials and often poses a particular natural resource on the brink of extinction. Many beautiful corners of the world, not excluding protected areas is significantly affected by the

inflows of tourists - "nature lovers", which is fraught with disastrous consequences for biodiversity of these places. The pursuit of "natural" building materials and often poses a particular natural resource on the brink of extinction. Many beautiful corners of the world, not excluding protected areas is significantly affected by the inflows of tourists - "nature lovers", which is fraught with disastrous consequences for biodiversity of these places. The pursuit of "natural" building materials and often poses a particular natural resource on the brink of extinction. Many beautiful corners of the world, not excluding protected areas is significantly affected by the inflows of tourists - "nature lovers", which is fraught with disastrous consequences for biodiversity of these places.

Tourism, as noted above, also leads to environmental pollution, dumping of raw sewage into the waters of rivers and seas, transportation emissions include carbon dioxide and oxide of nitrogen, and the production of garbage and other solid waste (eg, committing cruises Court of tourists in Caribbean alone, each year more than 70 000 tons of waste). Construction of infrastructure and tourist destination also adversely affect the environment.

For example, 3/4 of sand dunes on the Mediterranean coast between Spain and Sicily did not actually exist mainly because their allocation and under construction, is designed to serve tourists. Whether tourists remain satisfied with the resort of time ,. Since the pristine natural environment - a prerequisite for a pleasant pastime, its retention is 100% important economic factor for the tourism industry, for those policy makers in this area, experts and guides most travel companies, carried out both independently and in collaboration with private and public sectors. Shall be adopted restrictions and regulations to prevent and minimize the damage that tourism puts biodiversity. Such inputs should include monitoring of existing actions assessment of the environmental new tourism projects.

Particular attention should be paid to the preservation of the unique and vulnerable natural systems, such as small islands, coral reefs, coastal zone.

On the 1st local residents can account for up to 130 tourists. From 1st hand, it stimulates the production of all products required for use by tourists, providing download all service areas, and on the other - can interfere with the normal life of citizens, and if market conditions change and cause seasonal surge in unemployment and worsening social tension. Tourism industry is characterized by a high degree of monopoly, which implies a concentration of services and profits in the hands of a small number of international corporations. In many of the countries most of the tourist facilities owned by foreign capital. There should be a fair balance between local actors and investors. Locals, as the main source of labor should be interested in an interesting and well-paid bot

On environmental summit in Rio de Janeiro (in 1992) Industry was presented to the World Council of Travel and Tourism (VSPT) - one of two international organizations involved in the introduction of this activity, and the topic touched only indirectly or in the context of other issues . However, the agenda for the XXI century formulated very far-sighted belief that travel and tourism industry has enormous potential, allowing it to make a constructive contribution to the sustainable development of all regions of the world. Of course, these problems can not be left unattended. Much can be done with reasonable planning and design, rational planning and rational use of possibilities - that which can be useful to sustainable development. In order to follow the basic principles of the concept of sustainable development, one should evaluate the nature and intensity of the action provided, carry out environmental inspections, take into account the potential burden on the environment, optimize resource consumption,

invest in new technologies. All factors, interests and obligations of interested parties - governmental, industrial and social circles - must be taken into account, and the latter, of course, are both tourists themselves and the local population. But positive factors from the development of tourism is more than the problems that it generates.

First, thanks to tourism and creating new jobs; work related to tourism, often highly paid, therefore, income tax revenues more people and grow.

Secondly, the state through the importation of foreign goods needed for consumption by tourists and further development of tourism can introduce customs duties on imported goods.

Third taxable services provided to tourists (hotel accommodation, meals, drinks sale, transport).

Fourth, pay taxes on both local and foreign firms that have the right (license) to engage in tourism business in the country. There is a possibility of revenue from tourism to direct financing of infrastructure development, restoration and renovation of historical and cultural monuments, the implementation of environmental programs, social development programs and more.

The concept of ecological and economic processing can be understood as a separate study of social problems (position) or stage a comprehensive study aimed at obtaining information and justification of the recommendations. The national field of recreation and tourism, it covers a range of measures, methods and assessment methods that make it possible to determine the level of social well-being, satisfaction and business users of its business.

At the same time diagnosis should be carried out on the basis of interdisciplinary connections of social work, economics and other spheres of scientific knowledge. Thus, we are faced with the task of identifying the risk factors that affect

the safety of tourism, evaluate them, analyze ways to minimize them, and make suggestions on developing mechanisms for funding these activities. . These results may have, in the first place, an internal (from the point of view of the functioning of the sphere) and an external (value for the whole economy) character; secondly, direct manifestation (the number of tourists, well-off persons, the number of business entities, etc.) or mediated - after a certain time (improving health, duration and quality of life of the population, etc.).

Ecological-economic assessment is the basis for determining ways to expand the opportunities for people to use free time in order to improve health, cultural awareness and sports activities, forecasting further promising development of the recreation and tourism sector. Ecological-economic function is one of the major in demography, social economy and politics.

Thus, based on the foregoing, one can conclude that in the socio-economic aspect of recreation - a broader concept, including tourism as one of the constituent types of recreational activities. On the basis of the generalization of the many-sidedness of definitions, the interpretation of the notion of recreation and tourism as a social phenomenon is grounded on the one hand, which, on the one hand, embodies relations with the restoration of health and the development of human vital forces, on the other hand, represents an important part of the national economy, combining an extensive system of recreation and tourism establishments, infrastructure companies and other related industries that have close productive and economic links, share resources in order to meet diverse s health, cognitive, cultural and other needs, depending on the quality of the environment and the safety of tourists.

Under the current legislation of Ukraine the subjects of tourism to ensure the safety of tourists must: inform tourists about the dangers when traveling on the implementation of

mandatory requirements and precautionary or preventive measures (medical vaccinations, etc.); create safe conditions in places of tourist services, to ensure proper installation of hiking trails, walks, tours, etc. carry out special safety requirements at time of travel services with an increased risk etc.

Those who organize tourist exploitation of resources required to ensure compliance with the requirements of environmental protection and cultural heritage, and to take measures to minimize or cease the harmful effects on the environment and socio-cultural environment and to compensate for losses incurred while. The state ensures protection of the legitimate rights and interests of foreign tourists in accordance with the law and international treaties of Ukraine and guarantees the protection of the legitimate rights and interests of citizens of Ukraine traveling abroad.

The goals of ecological and economic sphere of recreation and tourism are to accurately assess the situation and identify challenges to meet and coverage of tourism and health services. Therefore, to determine the social priorities of recreation and tourism is extremely important analysis of trends and general coverage (total and individual groups) related services, the number of businesses, employment in this sector and related industries and so on. The corresponding indicators in the matrix of social priorities the development of recreation and tourism are in tabl.2.3.

Table 2.3.

Indicators of social development priorities recreation and tourism areas *

Indicator	Direct results	Indirect results
Local results	Coverage of recreational and tourism services. Reach specific groups of recreational and tourism services. Employment in recreation and tourism	Improvement in health and life expectancy. Improving the quality of life. Increased cultural and patriotic standards. Implementation of a

	activities. Rising incomes and scope of entities sphere of recreation and tourism	healthy lifestyle. Improved quality performance of the areas of recreation and tourism (improving service quality, improving logistics infrastructure, diversification of services)

2.4. Formation of informational and methodological framework for assessing the socio-economic impact of national scope recreation and tourism

Recreation and tourism is an important part of national economy in more and more countries, increasing its production volumes and investments in the global tourism market. General

secretary World Tourism Organization (UNWTO, UNWTO) stated, what sector tourism play more important role to stimulate growth and international trade, so you should raise it a priority and make the most appropriate potential [100].

According to latest reports release Barometer international tourism UNWTO, earnings tourist centers from around the world produced international visitors costs for placement and food, fun, shopping and other services and products reached in 2016 close 1159000000000. USD. US, more than in the previous year 5% [101, 102]. The leaders in attracting tourists are: Europe - 42% Of revenue international tourism, Asia-Pacific Location - 31 and American region - 20%. Last place analysts prefer Middle East - 4% share total revenues and Africa with those of 3% [101].

These results are explained by the following factors: the most significant growth in the amount of 35 billion. USD. US to provide tourist services in 2016 took place in Europe - to 489 billion. Dollars. USA. Asia-Pacific Location increased its performance in 30 billion. To 359 billion dollars. USA. In America, growth was 16 billion. (to 229 billion. USD. USA), Middle East - 47 And in Fritz - much less - 34 billion. USD. USA.

Significant positive dynamics of these regions can be explained by a professional systematic approach to the management of the tourism sector of the state scientists, economists, analysts, business elite [103, 104, 105, 106, 107]. Thus, the rapid development of tourism contribute to Asia extremely special ethnographic resources. Tourism in the United States properly funded, supported by special government programs. This area of activity is recognized in the United States' second major employer after the health care, the third sector to attract foreign currency after agriculture and chemical industry "[108, p. 57].

Analysis of the contribution scope recreation and tourism development of the Ukrainian economy should be based on the position of its significant natural, historical and

ethnographic potential. Only resort and recreational areas occupy almost 13% of the state [109, p. 211-217].

By using a matrix of social sphere diagnosis recreation and tourism may diagnose it in value terms. This should analyze the dynamics of incomes Ukraine using statistical information. During the 2010-2016 biennium. Been a slight increase in the real income of the population, with the highest rates, ie 117.1% in 2010 compared with 2009. However, in the previous period there was a decline in this indicator. Rising incomes empowers travel and recreation and health (tab. 2.8).

Table 2.8

The dynamics of household income and the number of citizens of Ukraine who went abroad 2010-2016 years. *

Year	Dynamics of incomes		The number of citizens who traveled abroad	
	bln. UAH.	percent from the previous year	thousand. people	percent from the previous year
2010	128.7	-	13422	-
2011	381.4	296.3	16454	122.6
2012	1101.2	288.7	17180	104.4
2013	1266.8	115.0	19773	115.1
2014	1457.9	115.1	21433	108.4
2015	1548.7	106.2	23761	110.9
2016	1531.1	98.9	22438	94.4

* Source: [74].

Proved dependence of the number of tourists visiting the income level of the population of Ukraine as a polynomial of the second degree and exponential function (Fig. 2.5).

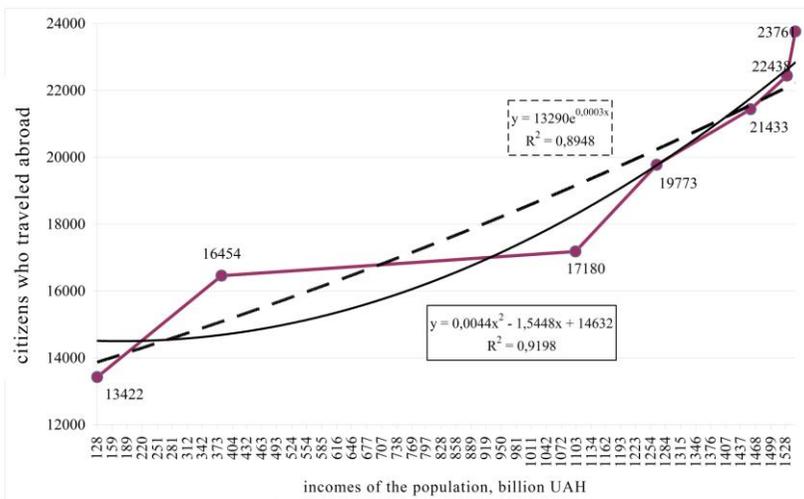

Fig. 2.5. The dependence of the number of tourists visiting-income Ukraine

Regardless of the method depends presentation, there is a high level of distress communications (91.9 or 89.4%), confirming the dependence of recreation and tourism areas of effective demand and, consequently, its level of income. Therefore, to ensure the welfare of the population is essential for accelerating human development.

important macroeconomic indicator is the gross domestic product (GDP), measured as the difference between output at market prices and intermediate consumption at purchasers prices, or the sum of gross value added economic activities and taxes on products except subsidies on them. Since 2010, GDP calculations carried out by economic activity (NACE 2010) [74].

During 2010-2016rr. GDP (USD) per capita (PPP) was as follows: 2010 - 1828.7 UAH .; 2012 - 2974.0; 2013 - 3570.8; 2014 - 3856.8; 2015- 4030.3; 2016. - 3014.6 UAH. [110].

Construct regression and stochastic schedule depending on the number of tourists visiting the level of GDP per capita (rys.2.6).

Circulation data on the distribution line regression is picking its algebraic expression that provides the maximum value of the index . Get regression equation smooths trend changes coefficient of multiple determination () Equal to 0.898 or 0.888.

Thus the observed dependence of the number of tourists visiting the level of GDP per capita Ukraine in a stepwise and exponential functions with high levels of distress communications (89.8% or 88.8%), which proves the expediency of enforcing the social sphere diagnosis and recreation and tourism the need to ensure the growth of GDP per capita.

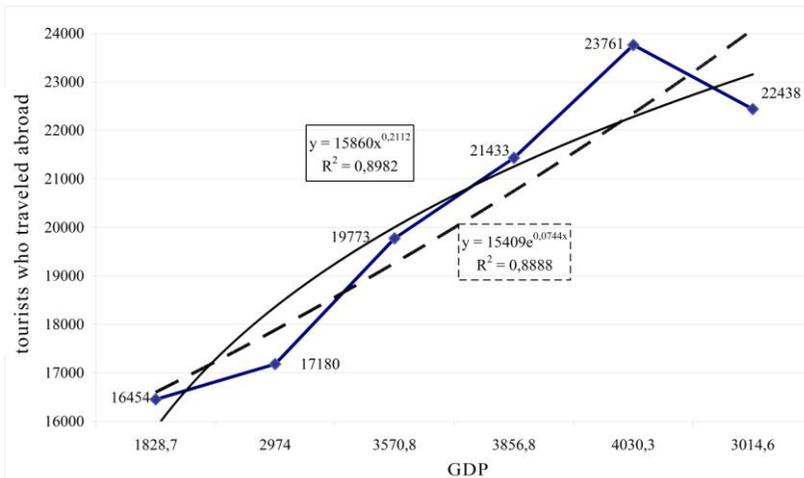

Fig. 2.6. The dependence of the number of tourists visiting the level of GDP per capita

Expanding the population of Ukraine travel and recovery associated with higher levels of household income and

economic stability due to the growth of GDP. Because the latter gradually increase the proportion of citizens who can afford a comfortable rest and recuperation and thus are the target segment for operators of tourist services.

Contribution to GDP carried out economic activities of tourism and recreation, the volume of which depend on complex factors. Among them, we selected two quantitative indicators: number of hotels and similar accommodation and resorts with treatment.

king-size income from tourism in the regions of Ukraine for 2016 falls on city Kyiv, Dnipropetrovsk and Kharkiv regions. As we study the hypothesis put forward the claim that the income of tourist activity in regions stochastically depend on the number of hotels and similar accommodation and health centers with medical treatment [111].

Using stochastic models describing patterns associated with simultaneous exposure to the object of many factors that can be clearly identified only in mass observations. The most common method of building such models are - multivariate statistical analysis, including correlation and regression. As practice shows, are formed in this way stochastic models have the advantage in the quantitative description of causal relations in economy and social sphere in comparison with deterministic models. Better understand the nature of the phenomenon can be achieved by identifying quantitative ratios that look like regression. In turn, this allows us to influence the identified factors intervene in the economic process to get the expected results.

According to the classical regression analysis of economic processes described by one is not functional and stochastic regression equation. There each set of explanatory variables, with only essential, can meet multiple values explicable variable. Uncontrolled or unmeasured factors and measurement errors included in the random term (deviation). It

is assumed that the explanatory variables are not random and not correlated, and the random component has a diagonal variance-covariance matrix with equal diagonal elements (variances) [112, c.10].

For graphical and analytical representation depending incomes of tourist activity in the regions on the number of hotels and similar accommodation on the number of health centers with modern medical treatment used software packages such as Microsoft Office, which provides a significant acceleration of labor-intensive analytic transformation. One of these programs, which may simulate stochastic dependence is a spreadsheet Microsoft Excel.

The degree of approximation of the mathematical representation of patterns of change in the index under the influence of selected factors reflecting coefficient of multiple determination [113, p. 120]:

(2.1)

where - the actual value of the i -th target;
- the average rate for the period studied;
- deviation of actual terms of the estimated
zahladzhuvanoyi point line.

With this formula it follows that if Then, that when the sample values fall in the line of regression, the coefficient of multiple determination takes the value 1. The lower rejection valuation data and the regression line, the greater the coefficient of multiple determination unit close to [113, p. 120].

Studies have shown that the description of economic processes using a single regression equation is not enough because of the many interrelated causes and effects. Therefore, to properly reflect the real relationship in economic processes appropriate to use a system of regression equations. The estimated value of a random member of the regression in many cases (especially when analyzing time series) reject the basic assumptions of the classical regression analysis, as evidenced

by reasonable tests to test hypotheses about the appearance variance-covariance matrix of random deviation. The idea of the relationship between economic variables and assumptions about the overall look of this matrix have led to a new type of stochastic models - econometric [112, c. 10].

Econometric model is a logical (usually mathematical) description that according to economic theory is particularly important in the study of a problem. Typically, the model has the form of equation or system of equations describing the isolation researcher interdependence between economic performance [112, c. 15].

GDP dependence on the volume of tourism revenues subjects studied by the methods of econometric modeling.

As the dependent variable in our model used indicator Y (incomes of tourist activity million) and be independent - x1 (number of hotels and similar accommodation) and x2 (number of sanatoriums of treatment).

In order to account for the influence of other factors on the resultant variable in econometric models introduce additional regressors single member of x0 for free, bringing classical stochastic regression function takes the following form:

$$(2.2)$$

and for the individual and the first element - is:

$$(2.3)$$

The additive value of u in econometric models reflects the deviation of actual data values dependent on simulated.

$$(2.4)$$

where X - matrix consisting of 6 rows and 4 columns (tab. 2.9);

* Source: developed by authors

Naturally, research any model may have practical value if it is adequate to the phenomenon under study is fairly well reproduces the real situation.

Econometric model that explains the behavior of one indicator is a single equation, a model which describes the change of several indicators - with the same number of equations. The model can also be identity, reflecting the functional relationships in a particular economic system. Since this model combines not only theoretical, qualitative analysis of relationships, but empirical information is in it, as opposed to just an economic model, stochastic remains always available. It probabilistic characteristics of these residues contribute to the quality of an analytical model form. Econometric model - a system function or functions describing correlation and regression relationship between economic performance, and depending on the causal relationships between one or more of these indicators are considered as dependent variables, and others - as independent [112, c . 15].

Sufficiently high level of distress dependence (53%) between variation revenues from tourism in the regions of Ukraine and the distribution of hotels and similar

accommodation, sanatoriums and boarding houses with treatment gives rise to study Depending pair correlation between variation revenues from tourism and the number of hotels and similar accommodation. To represent dependencies used vehiclelesspreadsheet Microsoft Excel, the results displayed graphically polynomial method (Fig. 2.7).

As a result of the imposition on distribution data regression line, it is picking algebraic expression that provides the maximum value of the index Obtained regression equation - second degree polynomial that eliminates variable trend of multiple determination coefficient of 0.522:

$$y = 3E - 05h^2 + 1755 + 1,162h. \tag{2.8}$$

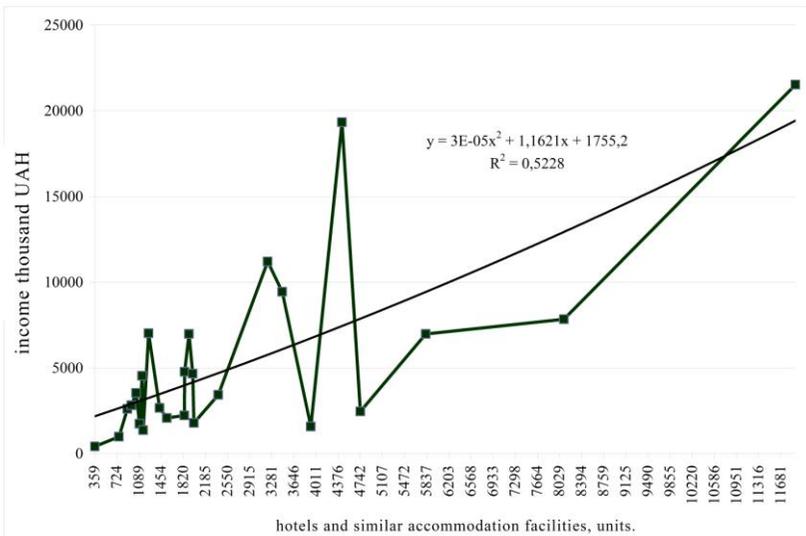

Fig. 2.7. Dependence income of tourist activity on the number of hotels and similar accommodation, sanatoriums treatment

The closer to unity, the stronger the relationship between the study variables. This makes it possible to affirm the close relationship between the incomes of tourist activity

and the total number of hotels and similar accommodation and resorts with treatment.

Thus, other conditions equivalent variation revenues from tourism to 52.2% depending on the variation of hotels and similar accommodation and resorts with treatment, and this dependence is represented as a polynomial function (see. Fig. 2.7).

Simulated our relationship is an important tool of abstraction that helps isolate, analyze and impersonate essential for Ukraine characteristics (properties, relationships, structural and functional parameters) areas of recreation and tourism. To ensure business revenue growth of economic activity, particularly important mathematical modeling, since other experiments this is not always appropriate. Through the use of powerful mathematical tools built our model is the most effective and most perfect method of drawing up plans and forecasts for future periods. In turn, mathematical methods can not be applied directly on reality, but only in respect of mathematical models of a range of phenomena.

To be an effective tool for the study of economic processes, mathematical model must first meet the following requirements [112, c. 21]:

- be based on economic theory and reflect the objective laws of processes;
- play function properly and (or) the actual structure of the economic system;
- meet certain mathematical conditions (solution have agreed dimensions, etc.).

Even though you are using an econometric approach to modeling depending on revenues from tourism and the number of hotels and similar accommodation, facilities or spreadsheet Microsoft Excel, always received a high level of distress communications. This indicates that the regions of Ukraine variation distribution of hotels and similar accommodation,

health centers significantly affects the treatment of income from the provision of travel services.

The availability of recreation and tourism and socio-cultural services depends on the actions of a macroeconomic nature factors, including GDP, expenditures of state and local budgets, income, wages, and sociodemographic characteristics of the population, including citizens of subjective assessments of their needs, which generally determine the choice of priorities in the consumption of services. Here is an analysis of the dynamics of tourism and recreation, social and cultural services for the population consumed 2012-2016rr. (Tab. 2.11)

Table 2.11

Dynamics of tourism and recreation, social and cultural services sold to population by economic activity (including VAT) *

Activity	2012	2013	2014	2015	2016	2016 / 2012%	2016 / 2015, %
The volume of services sold to the population, mln. UAH	58439.5	68905.8	74876.1	80974.2	78837.7	134.9	97.4
per one person USD.	1274	1531	1642	1780	1833	143.9	103.0
Temporary accommodation and catering mln	2738.2	3097.7	3311.6	3673.2	9067.1	331.1	246.8
Health care and social assistance mln	3767.3	5011.7	5153.6	5736.3	4829.0	128.2	84.2

mln							
-----	--	--	--	--	--	--	--

Source: [114, p. 276-277; 74, p. 266-267].

Apparently, there was a growth of paid services sold to the population in 2016 compared to 2012-m p. 1.3 times (mainly due to the price factor, improving economic activity - by 33.6%) in per capita - 1.4; in the arts, sports, entertainment and recreation - in 7.9, temporary accommodation and catering - 3.3, health care - in 1,28 times. Instead activities in the field of education characterized by decrease of 12.7%.

Services in arts, sports and recreational facilities, temporary accommodation and catering, education, health care and social assistance were unequal structure for 2012-2016rr.

The share of services arts, sports, entertainment and recreation in the total volume of paid services rendered to the population increased by 14.1%, temporary accommodation and catering - by 6.8%, and education services decreased from 5.2 to 3.4 %, or 1.8%, health care and social assistance to the population - by 0.3% (tabl.2.12).

Thus, the provision of recreation and tourism, social and cultural services to the population growth trends have paid services temporary accommodation and food services, arts, sports, entertainment and recreation and limit public access to essential social services - education, health care and social assistance - and, consequently, increased social differentiation for their consumption. In this regard the prospects for providing recreational and tourist paid services should be assessed taking into account changes in the cost of services, resulting in a possible redistribution of consumer spending patterns of households, which affects the level of public recreation and tourism services [39, p. 324].

Table 2.12

The dynamics of effective demand for services specified indicator of tourism and recreation, social and cultural services to households. Statistical survey showed that the structure of households as a whole there is a slow but steady increase in spending on recreation and tourism and socio-cultural services (tab. 2.13, ext. Z.1).

Table 2.13

* Source: compiled according to the State Service Statistics of Ukraine

Since 2012, the structure of consumer spending is amended as follows: the cost of trips to holiday homes, the recreation centers, camps, etc. - to "Restaurants and hotels", namely group costs for services related to temporary accommodation. In previous quarterly publications, these costs are included under the sections "Miscellaneous goods and services" and "Recreation and culture". Benefits to pay for trips to holiday homes on recreation in the camps, etc., are taken into account as a part of total household expenditures also included to "Restaurants and hotels" [115, p. 353].

Costs for recreation and tourism services by households Ukraine characterize social differentiation of the population in terms of consumption of these services. Consider the distribution of household expenditures by income level on socio-economic and decile groups. According to the State Statistics Service, in the first place, using eleven groups represented interval number of household expenditures depending on the size of income. This approach is mainly used to study household consumption of services depending on their financial capabilities. Second, using statistical grouping households by decile (10% - to) groups, allowing you to provide a qualitative assessment of differentiated services consumption by the criterion of justice [39, s.325]. So,

Analysis of the dynamics and structure of cash household expenditures for the 2012-2016 biennium. Shows that the effective demand for recreation and culture and restaurants and hotels, healthcare, ahead of the demand for education in all socioeconomic groups in terms of income. Overall spending on recreation and culture and restaurants and hotels, healthcare and education for all groups of households with minor differences.

Characteristically, in the low-income groups of the population (from UAH 300 to UAH 1020 - in 2012 and from UAH 480 to UAH 1,560 - in 2012-2016), the cost of recreation and culture, restaurants and hotels, health care and education in the dynamics varies insignificantly, which indicates a low level of satisfaction of needs for these services.

In medium and high-yield group of household expenditure on recreation and culture and restaurants and hotels, health ahead of spending on education. Most clearly discernible trend over the 2012-2016 biennium. For example the distribution of household expenditures by decile group (ext. Z.2-Z.3).

In households that belong to five to ten deciles, spending on recreation and culture significantly higher than in the first-fourth. In the last two deciles households (ninth and tenth) the cost of recreation and culture are the highest, indicating that these kinds of needs are met only wealthy people. Thus, the cost of this service are more differentiation in decile groups than socio-economic groups.

In respect of the main trends in effective demand for services during the 2011-2016 biennium., Special interest is the distribution structure for household self-assessment of their income, depending on the amount of increase in money income (ext. Z.4-Z.5).

According to the economic expectations for the next 12 months decile groups depending on the size of average equivalent cash income 2015 malodohidnyh populations prevail costs physiological needs: clothing, footwear, shelter, food and medical treatment. Thus in the second, third, fourth and fifth groups of paid services need rest goes to the first place (rys.2.8, ext. Z.6).

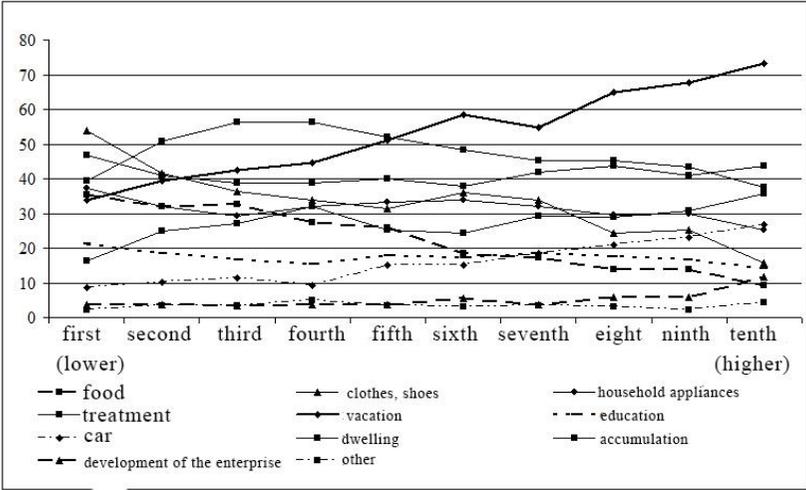

Fig. 2.8. The distribution of households by income level, economic expectations for the next 12 months decile groups depending on the size of average equivalent income, 2016.

To analyze the quality of life State Statistics Service of Ukraine in October 2015 conducted a modular survey of 10.6 thousand. Households that participated in the Survey selective regarding their income and consumption capacity. The program included research study perception of signs of poverty and deprivation (deprivation) in their consumer opportunities and analysis of distribution to households in certain manifestations of deprivation of opportunities to not only meet the required minimum physiological needs, but also those related to the development of personality and providing adequate comfort level of existence [116].

According to the survey of rural residents than urban, suffered from almost all forms of poverty and deprivation. A significant portion of households had no money for a family vacation away from home, and not with relatives in their home for at least one week per year (45% of rural and 37% urban households).

Deprivation associated with low infrastructure development, particularly related to tourism development, experienced 46% of rural (urban - 4%) households due to lack of facilities providing personal services, 42 (4) - because of insecurity settlement services ambulance, 29 (6) - in the absence near the home health agencies, 25 (2) - in the absence of regular daily transport to another settlement with more developed infrastructure and 15% of rural (urban - 2%) - because of the lack of housing near retail facilities [116].

World experience confirms that the economy of developed countries depends on how small restaurants, shops, service centers, hotels, travel agencies, local factories operate. Small business in them has long taken shape in independent structural divisions of small business. Such enterprises are mobile, maneuverable and cost effective, in their activity they are close to consumers (tourism, trade, production of services), are able to respond quickly to changes in demand and take into account the wishes of customers. By creating a significant number of jobs and occupying a significant share in the production of GDP, a small enterprise forms the core of guaranteed employment for most of the population, provides its welfare and plays a politically stabilizing role in society [117].

Unfortunately, Ukraine has not created the conditions for sustainable development of small business and its level is low. Small (regardless of ownership) defined entities in which the average number of employees during the reporting fiscal year does not exceed 50 people, and gross revenue from the sale of goods (works, services) during this period is not more than 70 Million [118].

The value of small businesses in the national economy and in particular the tourism and recreation sector is as follows:

Firstly, employment, ability to create new jobs to absorb surplus labor - the main feature of small business, because

when large enterprises, a reduction in jobs, small firms not only retain, but create new jobs;

and secondly, small business, being antitrust in its essence, helps to establish a competitive relationship. Characterized by numerous composite elements and high dynamism, they are significantly less monopolized than large enterprises. At the same time, under the conditions of narrow specialization and the use of innovations, a small enterprise is an effective competitor, which undermines the monopoly position of large corporations;

Thirdly, the sector responsive to changing market conditions, customer demands and market economy provides more flexibility;

Fourth, small business serves easing social tensions and democratic market economy, because it is fundamental to the formation of the middle class population.

So small businesses in the recreational and tourism sector - a required element of a market economy, the engine of economic and technological progress in society, an important stabilization mechanism and means of implementing a particular business potential of the population.

Analysis of the statistics shows that during the 2012-2016 biennium. The proportion of employees of small businesses in the total number of employees was 26,1-25,9% of economic activity, particularly in enterprises that conduct real estate transactions - 62,9-70,9, temporary accommodation and catering - 50,7-45,3, education - 47,6-57,9, wholesale and retail trade, repair of motor vehicles and motorcycles - 43,1-37,9, health care and social assistance - 35,9-46,9, art, sport, entertainment and recreation - 34,9-26,2, Activity in administrative and support services - 39,8-34,7%. Consequently, it is in these kinds of economic activity preference among small enterprises, while in industry - only 11,4-11,7%, agriculture, forestry and fisheries - 24,4-31,

But, unfortunately, small businesses do not perform the role of a leading sector of the market economy, as evidenced by their performance and economic activity, the share of sales (goods and services) 2012-2016. Was 16,9-17,2% of total sales enterprises by economic activity, particularly in enterprises that conduct real estate transactions - 57,3-58,2%, temporary accommodation and catering - 31,2-32,3, education - 38 , 9-58,5, wholesale and retail trade, repair of motor vehicles s vehicles and motorcycles - 25,1-22,7, health care and social assistance - 23,8-30,3, art, sport, entertainment and recreation - 26,5-7,1, in administrative activity and support services - 45,2-38,6% [74, p. 288-289].

Table 2.14

Key indicators of small business in the economy and national recreation and tourism sector, and 2012-2016. *

A large proportion of small businesses in this area were unprofitable (2012 - 41%, 2016 - 33.7%) [74, p. 304-305]. This confirms the need for sound public support small businesses in the field of recreation and tourism Ukraine, closely

interconnected with obtaining social effects, increase living standards.

SECTION 3

STRATEGIC PROSPECTS recreation and tourism IN UKRAINE

3.1. Status and trends of recreation and tourism

Tourist and recreational areas in Ukraine make up about 9.1 million hectares (15% of the territory). Prior to the adoption of the Law of Ukraine "On Resorts" in the territory of Ukraine, by resolutions of the Council of Ministers of the USSR, the Council of Ministers of the Ukrainian SSR, the boundaries of the districts and sanitary protection zones of 27 resorts and the provision for 33 resorts were approved. Currently, only 27 territories can be attributed to the formal features of the resorts, while, from a legal point of view, none of the resorts completely meets the requirements of the Law of Ukraine "On Resorts".

The Law of Ukraine "On Resorts" provides for the creation of the State Cadastre of Natural Resorts of Ukraine. Failure to perform works on the determination of the boundaries of districts and sanitary protection zones of the resorts makes it impossible to develop and approve master plans of resorts, adjustments of urban planning documentation of settlements of resort areas. A negative consequence of this is

systematic violations of the legislation on the use of land for recreation and tourism purposes. The concentration of industry and agriculture within resort areas creates excessive human pressure. Because of underfunding and anti-erosion measures destroyed coastal areas and beach resorts.

Operational reserves of mineral waters ensure their use in volume over 64 thousand. Cu. meters per day, of which only 8% is used.

State inventory of natural medicinal resources Ukraine is not developed, is insufficient state control over their rational use and protection, adherence sanitary protection zones and so on. In general we can say that natural resources are used effectively, there is a danger of damage and destruction.

The situation in the sphere of tourism and activities of resorts in Ukraine is characterized by the following main factors:

- low level of awareness of the population of the country and the regulatory authorities in the sphere of tourism and activities of the resorts, the role and importance of tourism for the socio-economic development of the state;

- lack of established tourist resources and integral system of their rational use, uncertainty of directions of their development and development, ineffective and illegal use of unique natural and historical and cultural resources;

- lack of an effective system of protection of the rights and interests of tourists, provision of safe conditions at the objects of tourist visits and directions of tourist routes, timely provision of all kinds of emergency services to those who suffered during the trip;

- absence of favorable conditions for the development of the tourism industry, state investment policy in the field of tourism and the activities of resorts and appropriate support for the development of priority tourism types, in particular, inbound and inland, rural, ecological;

- the destruction of social tourism, tourism for practical inaccessibility of the poor, children, youth, elderly and special needs;

- lack of proper forecasting and planning of tourism, tourist flow parameters according to the available resource capacity, needs of the population and economy of the state, superficial and fragmented approach to the development and implementation of state and local tourism development programs;

- imperfection of organizational, legal and economic mechanisms of state policy in the sphere of tourism resorts and activities, weak interagency coordination and cooperation between state and local authorities;

- lack of a coherent and integrated management of tourism resources of the country, different subordination tourism resources, lack of specially authorized central executive authorities on the activities of resorts;

- insufficient normative, methodological and information support of local government, community organizations and businesses in the tourism resorts and activities;

- lack of quantitative, qualitative parameters and the structure and level of scientific, methodical and staffing, particularly in management at the state and local levels.

On state registration in Ukraine is over 130 thousand. Sites, including: 57,206 - archeological sites (418 of which are of national importance) 51364 - monuments of history, 5926 - a monument monumental art, 16293 - 'S interest of architecture, city planning, 3541. garden art and landscape

Operates 61 historical and cultural reserve, 13 of which have national status. The list of World Heritage Sites includes: Sophia Cathedral architectural ensemble of Kiev-Pechersk Lavra in. Kiev historic center of the city. Lvov.

Up to 70% of cultural heritage is in poor condition (one tenth facility in an emergency) and calls for work on the restoration and reconstruction, construction of tourist visits.

The low level of development of cultural tourism, caused mainly lack of legal provision on the use of cultural heritage tourism, limited transportation access most objects, abandoned objects of cultural heritage, not preparedness museum exhibitions and surrounding areas to travel visitors, including foreign tourists and people with disabilities. Most museum exhibits thematically complex and are based on outdated methodologies and technologies. Impede appropriate use of cultural heritage failure tourist guiding professionals and their skills inadequate. In the country the scientific and staffing in tourism carried out more than 130 universities,

If there is such a significant scientific potential is currently no practical recommendations to government regulation, integrated planning schemes, rational use of tourism resources, economic principles of functioning of tourism.

The current system of training generally does not provide the needs of tourism resorts and activities for specialists of middle and lower level managers who directly serve tourists. There are no standards for educational training, which is produced within existing professions not specialized literature and textbooks in the state language.

However, there is a state tourism infrastructure. According to State Statistics Committee, in Ukraine there are: 1,2 thousand. Hotel industry establishments with total capacity of 104.0 th., Which annually serves about 4.0 million. People, 17.5% of them - foreigners. Average hotel load fund is 31%; In addition there is 3.3 thousand. Sanatorium and recreational facilities with a total capacity of about 481 thousand. Beds month maximum deployment. Number of unemployed institutions - 22%. Generally spa and wellness facilities each

year taking about 3.2 million. People, 14% of them - foreigners. Power establishments used less than 40%.

As of January 1, 2006, 85% of hotel facilities were not certified for compliance with a certain category and 34% - for compliance with safety requirements. According to the data of the State Fire Safety Inspectorate, some of the means of accommodation do not meet the requirements of fire safety.

A significant number of accommodation facilities are morally and physically obsolete and have low competitiveness: annually they use only 7.5% of the total number of foreign visitors of Ukraine. Most of the funds spent on construction and renovation - own funds, domestic and foreign investments account for only 35%. Work on the reconstruction of privatized assets held back, largely due to lack of funds required from the owners.

The structure of the hotel establishments of Ukraine in terms of capacity and number of employees is not optimal. In recent years, tourism and recreational areas there was a significant number of private households that provide services for temporary accommodation. Lack of approved boundaries of districts and zones of sanitary protection of resorts makes it impossible to determine the number of such establishments. However, income households from providing accommodation in most cases are not properly taxed and their activities significantly increases the burden on local budgets in the maintenance of utilities and transport infrastructure and public services.

Transport and utility infrastructure of most tourist recreational areas characterized by: low levels of integrated transport networks and spatial (road) unity, roadside service and information arrangement, poor state of road surface and road safety, which affects the accessibility of tourist resources, reduces mobility and quality national tourism product. Roads of national importance first category (with four or more lanes and

carriageway width of over 15 meters) have a length of 2,254 kilometers, or merely about 1.4% of the total length of the road network paved Ukraine. In rural areas, almost 30% of farm roads subordination are not hard coating and during bad weather conditions become unsuitable for use. To achieve security of Ukraine roads of Europe need to build and upgrade nearly 200 thousand. Kilometers, including 60% in rural areas. In order to establish international relationships necessary to build highway international level.

Municipal Engineering is one of those areas, the level of which directly influences the development of tourism. Most acute problem is the availability of safe drinking water. Average water consumption is 320 liters per day per person, in 2 - 3 times higher than in EU countries. The analysis of the current state water management sector suggest that environmental issues become more and more extensive manner, a sharp deterioration of the main sources of drinking water. Lack of development of modern technologies are recycling and processing waste, landfills presence within the tourism and recreational areas, creating a significant environmental hazard like.

Weak growth has a network of tourist information centers, travel no representation Ukraine abroad and the official information portal, through which tourists, including foreign, could obtain information on national and regional tourist products.

3.2. Background and factors of development of recreation and tourism Ukraine

Measuring the impact of social functioning areas of recreation and tourism should include first of all assess the

potential of this area, opportunities and conditions for its development both in individual regions and the country in general. Based on the evaluation of existing potential, we can further analyze efektyvnist this sector, which, on one hand, the social dimension and manifested in the restoration and development of the vitality of man and society, on the other - is characterized by economic indicators and the state of development of recreation and tourism. The set preconditions and factors of development of recreation and tourism includes the availability of appropriate resources (potential) political, economic, legal, technological, infrastructural environment. There are the following groups of factors in its development: static and dynamic. The former include natural and geographical (nature, climate, topography, rich underground mineral resources), cultural and historical factors are held constant. People just adapt them for recreational purposes, making more available for use. Demographic, social, economic, logistical and political factors have different importance,

- external and internal. External - a demographic and social changes, economic and financial factors, changes in the political situation and legal regulation, the development of transport infrastructure, trade and so on. Internal factors act directly in the study area and associated with the organization of recreational and tourism activities [39, p. 278; 68].

Potential (*n.* BUILDING, *Eng.* potential, *it.* potentialn) - the opportunities available forces, supplies, tools that can be used [69]. The concept of the recreational and tourism potential covers all the features available forces, supplies, tools that can be used to meet the needs of the population in the area of recreation and tourism in order to create social and / or economic benefits.

Recreational resources or prerequisite for the development of recreation and tourism are the natural conditions natural sites, and any other resources of natural

origin that may be used for the treatment, rehabilitation, recreation and tourism [70, p. 104]. Thus, recreational resources - a combination of natural resources, socio-economic conditions and cultural values that are prerequisites for recreational needs of individuals and organizations on complex commercial and recreational public service [71, p. 138].

Recreation resources include natural recreational, cultural and historical resources, social (recreation and tourism needs, purchasing power of the population) and economic (institutional and infrastructural support) conditions and resources.

Thanks to the availability of sufficient climatic, cultural and historical resources in the Ukraine has all the prerequisites for the development of many types of recreation and tourism. And in most parts of all the components available recreational resources, enabling them to actively enter the tourism market.

Natural recreational resources Ukraine is extremely diverse and include: recreational landscapes (forest, coastal, mountain), health resources (mineral water and mud), natural protected areas (national natural and regional landscape parks, biosphere reserves, parks, monuments, garden art, etc.), the territory of historical and cultural purposes (monuments of architecture and urban planning, historic and architectural reserves, etc.). [61].

Natural recreational resources are divided into climatic, Flora-fauna, landscape, mineralogical. To climate include: snow, comfortable temperatures, periods of maximum solar radiation, the duration of the light of day, humidity, wind speed and more. Flora-fauna resources represented keeps bee and medicinal plants, hunting and fishing grounds, etc; landscape - terrain, mountains, forests, rivers and lakes, coasts and beaches, protected areas and objects like. Possibility of water recreation (boating and sport fishing, hydrotherapy, bathing-beach

holiday) depends on the water quality, bottom, beach strips and aesthetic properties of the environment.

The leading role of landscape resources is covered with forests, parks, parks, green areas of cities. Recreational forests account for about 10% of all forests of the state forest fund. Phytocuring resource limited settings recreational use of forests, water protection, their protective properties, healing effect on human health and hygiene favorable backdrop for treatment, recreation, tourism [63].

Forestry resources in Ukraine are rather uneven. Most forests are concentrated in the southwestern regions of the state. For forest and forest park areas, the main types of recreational and tourist activities are tourism and sports (hiking and skiing, equestrian sport, sports and licensing hunting, sports orienteering, etc.); phyto and climatic treatment; general recreation; collecting berries, mushrooms, medicinal plants, etc.

Protected areas and objects a special place in the structure of landscape resources, namely reserves and sanctuaries different forms and directions conservation, national parks, arboretums, valuable natural objects, monuments of nature and landscape gardening culture. Recreation and tourism activities in such places is allowed only to the extent that guarantees the preservation of these natural systems. Reserves and national parks created to preserve, reproduce and efficient use of natural complexes and objects which have a special nature, recreational, historical, cultural, scientific, educational and aesthetic value [72, 73].

In Ukraine, the number of nature reserves and national parks and their area has increased in recent years, particularly in 2015 compared to 1990 m - respectively 3.38 and 4.15 times (tab. 3.1).

Table 3.1

As part of the natural and recreational resources of importance due Therapeutic properties have the mineralogical resources such as mineral water and mud. The first are natural waters with medicinal properties that define the basic lithium salt composition or a high content of bioactive components and gases, radioactive materials, high temperature. Mineral water baths Ukraine include major groups, namely:

A - water without specific components and properties, the therapeutic effect of which caused major ion composition and general mineralization. They are used at resorts Mirgorod (Poltava region), Kuyalnyk (Odessa), Truskavets (Lviv), Feodosia (Crimea), Ochakiv (Mykolaiv region) and others.

B - carbonated water, curative properties are associated with the presence of large amounts of dissolved carbon dioxide and ionic composition and general mineralization. Used in the resorts Glade (Zakarpattia region), Pigeon in the sanatorium "flower meadows" Soimy - in the sanatorium "Verkhovyna".

B - sulphide water, physiologic and therapeutic effect which is caused by the presence of sulphides (free sulfide ion and hidrosulfidnoho). Used in the resorts Great Luben (Lviv region), bruises (Zakarpattia), Church (Ivano-Frankivsk region).

D - iron, arsenic or arsenic water with high content of manganese, copper, aluminum. The therapeutic effect is due (other than their ionic and gas structure and mineralization) one or more of these pharmaceutical active ingredients. Used in the sanatorium "Mountain Tisa" (Transcarpathian region).

∞ can - bromine, iodine and high in organic matter of water used in the resorts of Truskavets (Lviv region), Berezovskaya mineral water (Kharkiv region).

D - radon (radioactive) water used in the resort Khmilnyk (Vinnytsia region) [75, p. 389-390].

Consequently, most of the mineral water is concentrated in the western part of Ukraine, in particular Zakarpattia and Luhansk, Dnipropetrovsk, Poltava, Rivne, Ivano-Frankivsk, Kharkiv, Zhytomyr, Vinnytsia, Khmelnytsky, Kyiv, Cherkasy, Donetsk and Zaporizhia regions. Some sources were the basis for the formation of such famous resorts as Khmilnyk, Truskavets, Morshyn, Nemiroff [62].

The second component mineralogical resources - mud, which are deposits of ponds, marshes (or its site), mud hills. They can be used for therapeutic purposes in health centers, dispensaries near fields, export to other hospitals, import. Ukraine has very significant reserves of therapeutic muds, which are concentrated mainly in southern and south-western regions. On the basis of mud deposits in Ukraine operate oldest mud resorts - Berdyansk, Yevpatoriya, Kuyalnyk, Saki, Khadzhybeysky more. In the north-western areas of common peat mud which they are used at resorts Mirgorod, Morshyn, Nemiroff, Cherche more.

Total area of developed and potential recreational areas in Ukraine (without radiation contamination) is 12.8% (2013) of its territory and distributed according to the same natural features recreation areas: Carpathian, Transnistria, Dnipro, Donetsk-Azov, Poleski, Black Sea. In determining these regions is taken into account the following factors: geopolitical position (location area, the availability of human resources, transportation routes, sources of raw materials, energy, history of the territory, traditions, etc.), Availability of recreational resources, the state of tourism infrastructure, the demand for recreation and tourism, recreation and tourism policy in the region [62].

Usually, recreational resources are considered cultural, historical, including: historical, archaeological, architectural, ethnographic objects and cultural institutions (historical, archaeological and architectural monuments, works of monumental art, ethnographic heritage, folklore, arts centers and crafts museums, theaters, etc.). Their defining characteristic is the value, attractiveness, cognitive potential. Of great interest for the development of domestic and international tourism are - arhitekturni historical monuments of Kyiv, Chernihiv, Lviv, Odessa, Kherson and other cities.

Thus, Ukraine has a powerful capacity (natural, historical and cultural) for development of recreation and tourism. However, the development of national tourism and recreation exposed to significant aggregate environmental factors: political, economic, legal, infrastructure, etc., reflect the characteristics of social organizations in the country, formed historically.

An important prerequisite for the development of recreation and tourism needs of the population is defined as its social characteristics (mental, cultural and national features) and the ability to implement the economic costs related service (actually effective demand). The importance of recreation is

increasing against the background of the growing influence of the negative effects of NTP, including deterioration of the environment and the consequent public health. According to the study, improvement allows reduce the costs of temporary disability per employee per year for 3-4 days, to reduce the loss of working time reduction of mortality in working age for 6-7 days every year, to reduce exposure to treatment in the hospital for 2-3 days, increase productivity by 3%, reduce the number of visits to clinics 2 times [33,

Significant impact on the choice of methods and Recreation has a level of material security of the population. Depending on the income level of consumers recreation and tourism can be divided into three groups. The first group includes those with low incomes (teachers of schools and vocational schools, nurses and other public sector employees). Nevertheless, they exhibit relatively high activity against a variety of entertainment, recreation, sightseeing activities, purchase small gifts and so form the largest segment of consumers recreation and tourism in the international tourism exchange. The second group are people with average incomes (businessmen, doctors, university professors and others.), The primary purpose of outdoor activities related to cultural and entertainment events, and wellness-treatments. People with high incomes who show interest in the study of nature, culture and traditions of other nations and able to spend on tourism and recreation heavily form the third group. The structure of the market of recreational services also affects age population. Accordingly, tourism is divided into youth - those aged 15-29; adult - 30-59 and third age - 60 years and older.

On the recreational needs of the population affected by both subjective factors (tastes, preferences, fashion and various types of recreation areas, advertising, stimulating demand for recreational services, for cultural, sports, fairs and other events), and so the objective (eg , changes in household

income). Currently, only a small part of the population of Ukraine has the opportunity to meet their full recreational and tourism purposes in connection with the fall of solvency. So today should pay more attention to the development of suburban recreation for gardens, cottages in the countryside, cheap hostels, campgrounds, motels.

The external factors influencing the formation and functioning of the national tourism market include economic and political stability in the country, government policies supporting tourism activity and orientation of international activities, degree of integration into the world economic system, and fashion and image. The interaction of internal and external factors shaping the market conditions and business environment activities affect demand (its size, structure, rhythm). The level of development of the national tourism industry depends on the ability to meet the needs of different consumers.

Among these factors distinguish extensive, intensive and dissuasive. The former include the growth of the number of employees, amount of material resources to be included into circulation, build new recreational facilities; to intensive - training of personnel, professional and qualification structure and technical and technological base, rational use of material resources and more. Restraining factors affecting development of recreation and tourism and embrace the economic crisis, the growth of foreign debt, political and financial instability (inflation, stagnant rates), higher prices for commodities, unemployment, decline in personal consumption, poor environmental situation, bankruptcy of travel companies etc. [76, 77].

Stability and formation of the national tourism market largely depends on the relationship of international and domestic tourism. Sustainable development of the national tourism provided by the presence capacious domestic tourism

market, which is also the basis for the development of international tourism. In Ukraine, there is every reason for the formation of a strong market reception of tourists and generate market flows [78, p. 59-60].

This is largely ensured by purposeful state tourism policy aimed at creating an attractive image of the national sphere of recreation and tourism. Tourist attraction formed complex resources and activities, including:

- existing tourist resources (natural, historical, cultural);
- environmental situation in the country and some regions;
- pricing and transportation access offered tourist services;
- traveling comfort and quality of service.

Economic background - the development of business, the availability of human resources, capital, favorable environment for economic activity and more. Terms of the national tourism market is the level of national economic complex (especially related to tourism sectors), creating the possibility for the formation of appropriate tourism infrastructure (networks of different types of accommodation different levels of comfort - hotels, motels, tourist centers, etc., engineering infrastructure).

The most important prerequisite for the effective development of recreation and tourism is the availability of recreation and tourism infrastructure, hotels, motels, rest homes, boarding houses, sanatoriums, catering, transport, entertainment facilities, attractions and so on. It is worth noting that at the beginning of 2016. in Ukraine there were 1258 enterprises hotel industry a total of 100.67 th.. The form of ownership are distributed as follows: 40% in state and municipal property, 57th collective and 3% - in private. Recreational opportunities provided by Ukraine as the presence of 3304 sanatorium and health institutions of different

departmental subordination and forms of ownership, including resort - 487, health center - 357, bases and other establishments of rest - 2016, pensions holiday - 235

For the development of recreation and tourism infrastructure is a very important premise: transport security, adequate social infrastructure and material production, which contributes to recreation and tourism activities in the region, economic and geographical position, the nature of settlement in recreation areas and more.

In its functional purpose infrastructure recreation and tourism industry is divided into industrial (transport, communications, construction, water -, energy) and social (retail, restaurant business, community services, culture, children and medical institutions). An important condition for the formation of the national tourism market and its interaction at the regional and global levels is developed transportation component of the appropriate traffic, economic and formal accessibility [79].

Unfortunately, the state of transport infrastructure in Ukraine is extremely poor, it needs significant investment to create it in accordance with the world standards. Our country has to develop a network of highways and railways, airports, sea and river ports. Air, road, rail and river transport should provide transportation of tourists taking into account global conditions and quality of service [58]. Do not lose relevance problem of water supply and sanitation settlements, especially tourist centers and recreational areas.

For improvement of infrastructure in Ukraine required a substantial investment in its construction, including the central and local authorities, foreign and Ukrainian investors by the state, regions and communities.

Thus, the development of the national tourism market depends on a complex objective conditions and the factors that contribute to the formation and functioning of the national

tourism industry as interbranch complex to create a tour product. The latter has to meet the specific needs of people on leisure trips through the production and sale of goods and services tourist destination. Development of tourism should be consistent with national tourism policy, which - coordination of business and government efforts to strengthen the position of the country in the global tourism process, the global socio-economic and socio-cultural systems.

In our country formed all the prerequisites for tourism development and its tourism potential is currently not fully used, because the share of tourism in GDP accounted for only 1.5-2.5%. The main stimulating factors in this context are mainly infrastructural changes.

In general recreation and tourism Ukraine is developing dynamically, growing numbers of tourists and sightseers, and the amount of receipts from tourist services (tab. 3.2).

Table 3.2

**Key indicators of tourism development in Ukraine,
2007-2015. ***

Indicator	2007	2008	2009	2010	2011	2012	2013	2014	2015

* Source: Calculated by the author according to the State Statistics Service of Ukraine

At the same time there is a clear trend of domestic outbound tourism: the rapidly growing number of citizens traveling abroad for tourism, while the number of those who enter the country as well as domestic tourists is decreasing. Unfortunately, reduced foreign direct investment and development in the resort and tourist infrastructure (rys.3.1), the number of domestic tourists and tourists as well as foreigners who visited Ukraine for tourism. The sharp decline in living standards in the years 2014-2015. Probably will keep these trends will reduce the exit flow, but is unlikely to contribute to the growth of internal streams of tourists. Therefore need innovative solutions to enhance the use of existing capacity, the creation of new tourism products, competitive in Ukraine and abroad, support SMEs in the tourism sector, improving the quality and availability of

recreational and tourism services. The implementation will lead to systemic measures, according to our calculations, the increase in the number of tourists in 2025 to 6 million., Ie 3.2 times, including 1 million. Foreigners (2.9 times). The increase in domestic tourism, particularly social, will provide a congestion accommodation facilities and implementation of tourism potential accumulated. By 2025, the level of budget spending on tourism will reach 0.3% of GDP (see. Rys.3.1) [39, p. 283]. including social, will provide a congestion accommodation facilities and implementation of tourism potential accumulated. By 2025, the level of budget spending on tourism will reach 0.3% of GDP (see. Rys.3.1) [39, p. 283]. including social, will provide a congestion accommodation facilities and implementation of tourism potential accumulated. By 2025, the level of budget spending on tourism will reach 0.3% of GDP (see. Rys.3.1) [39, p. 283].

The experience of many European countries that have significant income from international tourism, it is advisable to create a tourist representative offices abroad to promote national tourism products.

In recent years, the tourism sector is undergoing profound positive changes, new routes, developing hotel infrastructure, increasing the level of tourist services, improving attendance tourist sites, tourist and recreational opportunities in Ukraine caused great interest among representatives of the international tourism industry [82]. The above significant impact on the dynamic growth of tourists and revenues from tourism.

However, the development of tourism in Ukraine is constrained by several factors: the lack of an integrated system of state management of tourism in the regions; lack of technical, organizational, informational and financial support entities tourism industry of the country; mismatch most tourist facilities with international standards; poor state of the tourism,

service and information infrastructure in the areas of roads and international transport corridors; insufficient supply of highly qualified tourism industry; imperfection regarding database objects tourism industry.

Within the framework of the State program of development of tourism specific issues have been resolved. In order to improve the situation in the tourism sector developed and adopted the Law of Ukraine "On Tourism", the Decree of the President of Ukraine "On measures to develop tourism and resorts in Ukraine." These regulations stipulate the main directions and prospects of tourism development in Ukraine.

Currently, tourism is adapting domestic legislation to international standards, improved contractual framework signed 40 international agreements on cooperation in culture and tourism with leading institutional bodies. In Ukraine carried out joint projects on the initiative of a number of international organizations to preserve the environment, deepen cooperation, economic and social development of potentially attractive aspect of tourism areas.

Today unconventional required innovative approaches to the management of the tourism sector in Ukraine at the level of the state and enterprises. Sustainable development of the domestic tourism industry against the backdrop of increased competition, increased demand for international and domestic travel products, customer requirements to fill, diversity and quality of tourism and recreational services requires science-based marketing strategy [83, 84].

With the growing economic and social efficiency recreational and tourist areas will be formed favorable conditions for sustainable economic growth, job creation, maintenance revenue and revenue. Achieving this is possible only through constant active promotion of local products to the domestic and international tourist markets, increasing the competitive advantages of domestic producers tourist product.

The state should encourage recreational and tourist activities in general, creating the necessary economic and political conditions, maintaining its overall image recreation and tourism the country, including funding for large-scale foreign and national PR-action. This will contribute to advertising attractive for recreation and tourism areas at both the national and international markets in languages strengthen globalization. In this connection it is necessary to state and local budgets provide the funds.

It is known that one of the priorities of socio-economic growth of the country, a significant factor of stabilization and structural adjustment of the national economy determined the development of recreation and tourism. It is said, particularly in the State Regional Development Strategy for the period up to 2020 [57].

Recreation and tourism might be a priority in the development of any modern state, if it has the necessary natural-resource potential and can increase investment activity, the implementation of strategic growth scenario, recreation and tourism competitiveness in domestic and international markets services.

In its tourist and recreational potential of Ukraine can become a tourist country of the world. Expanding international relations opens up new ways to promote the national tourist product on the international market, attracting global information space, excellence organization of tourism [59].

Geostrategic role of our country as a link between north and south Europe, Caucasus and Europe is obvious. Ukraine is open for international tourism cooperation based on common European integration processes and national priorities. Based on national priorities, public international tourist policy The opposite is implemented on the basis of economic feasibility and mutually beneficial cooperation with a particular country or

region, takes into account the specific features of the tourist market. [60]

The development of logistics recreation and tourism will depend on many factors: the recreational and tourist activity rate, increase its revenues, fluctuations in the price of the permit, the pace of economic reforms, introduction of Ukrainian currency and its convertibility, saturation commodity market, liberalization of foreign trade and so on. Because it processes to predict the Long-Term extremely important. In the immediate future, obviously, be kept downward trend in living standards. The main contingent of tourists will be provided with the most material part, so important is the question of government subsidies in the spa area.

Thus, we can conclude that Ukraine has a huge potential for recreation and tourism, which is characterized by its natural resources, availability of skilled personnel, material and technical infrastructure (an extensive network of recreational centers, hotels, etc.). The presence of substantial capacity allows countries to set ambitious targets for accelerated development of recreation and tourism, turning it into an important factor in human development. However, to bring the infrastructure into line with international standards of service quality required significant investment. Needs improvement mechanisms and ways to use existing facilities in the context of the goals of recreation and tourism.

3.3. Investigation of the stability and reliability of the current state of the tourism complex

In a globalized economy using climatic recreation and tourism resources driven by their specific functional purpose, which determines the priority profile of the tourism development of certain areas, regions and locations. However,

if at the functional purpose of certain resources can be made more or less clear distinction between subhaluznyy recreational sector (tourism, leisure, sports, spa treatments, etc.), the study of spatial organization of natural resources required is a comprehensive approach. Therefore, the recreational-tourist suitability riznoranhovyh regional economies monofunctional not actually happen - they are all to some extent, can meet the needs of tourist services or spa sanitation. This realization of specific functions of economic regulation of the tourism industry in the market possibly in the presence of four main components: a) capital; b) technology; c) personnel;

d) tourism resources. That means that not having the capital to purchase technology, hire staff and begin to engage in tourism. It is necessary to determine the place where the fourth component - tourism resources - is the cheapest, overall it determines the high profitability of tourism. But if tourism associated with the creation of tourist resources (rather than the consumption of ready-made), the cost of the tourist product is gradually increasing as tourism resources by means a series of natural and artificial man-made objects suitable for creating tourism product, we can confirm that determine the formation of tourism resources of tourism in a particular region. The author found that the main criteria that determine the suitability of the area for spa treatments is the presence of deposits of medicinal mineral water, wax, favorable climate, clean environment. The greater supplies of medical resources, the higher their therapeutic efficacy, the higher value are recreational areas. That such area is small in size, limited to the boundaries of the settlement, which houses the spa resources.

As you know, the natural potential of Ukraine make up the Black and Azov seas, relief, water (70 ths. Rivers, more than 3 thousand. Natural lakes and 22 thousand. Man-made reservoirs), forest, plant and animal resources. On this basis,

established 11 national parks, 15 national parks, preserves, arboretums, memorials of landscape art belonging to the protected areas. The deposits of therapeutic mud, mineral and radon waters belong to the recreational potential of our country, which is not only domestic but also international significance. Travel Resources have such basic properties as attractive, climatic attractiveness, availability, degree of scrutiny, excursions importance, and video landscape and environmental characteristics, socio-demographic, natural reserves, how to use and so on. These resources are used in health, tourism, sports and educational purposes. Thus, in the Carpathian region have the resources to sports type of recreational activity [136]. This includes skiing, tourism, hunting, Speleology subspecies.

The dynamic development of the tourism industry in the country requires all groups of tourism resources. Even at high attractive properties of natural resources without a communication, communications, municipal infrastructure, educational institutions, cultural monuments, art and more tourist activity to a wide range of customers is not possible. In these circumstances, despite its social and humane role tourism impact on the environment. Reducing the influence of the tourism industry on the environment is regulated at the national and international levels through:

- a) environmental education;
- b) restricting recreational and tourist pressure on natural resources;
- c) tax regulations.

Territorial structure TRC determined by a combination of tourist and recreational items, centers, nodes, districts and zones formed or shaped by a variety of factors. However, the territory of Ukraine is a heterogeneous regions in a historical context and in terms of socio-economic development. They differ in natural conditions, ethnic composition of the population, settlement systems, tension ecological situation,

economic potential, system of interregional relations, etc., resulting in a corresponding formed divisions of labor. All these factors are reflected in economic zoning.

1) the share of tourism and recreation industry in GDP, GRP countries (including the performance of the licensed business tourism, spa complex, hotels and other establishments of short - and long-term accommodation);

2) the share of tourism and recreation in total goods and services over time;

3) component structure of the tourism sector;

4) the number and quality of jobs in the sector;

5) comparison of revenues from international tourism to the export of goods and services;

6) the balance of income and expenditure on international tourism.

Statistical measurement of TRC state carried on the following parameters:

a) the number of visitors in the country / region;

b) their distribution by month / season;

c) the country of origin of tourists and their share in the total number of visits;

d) the dynamics of tourism flows for several years;

d) Expenditures in absolute volume and their distribution by various articles (housing, transportation, shopping, food);

e) the mode of transport and the type of housing used;

h) purpose of visiting; g) the sociological and demographic characteristics of visitors;

i) satisfaction of tourists traveling to the results.

This placement tourist and recreational facilities provides additional benefits host communities and regions including tourists using certain resources (unpolluted air, solar heat, beaches, hot water) with minor economic costs, provide financial revenues recreational facilities and local budgets due

to the specifics of recreational consumption and its form of payment, accelerate the investment process in almost all sectors, implementation of structural changes in favor of services and product ment commodities, diversification and improving the quality of products and services that have a positive impact on the labor market (detailed by the author in previous works.

So you can show that the TRC, unlike other economic activities, is extremely sensitive to fluctuations in environmental performance and environmental situation in the region, precisely because trend analysis requires a long period, which eliminates the impact of temporary factors on key performance indicators. As the TRC has a distinctly seasonal, for making suggestions and directions of further development is necessary to determine peak periods, ensuring the maximum number of visitors and periods with a minimum number of visitors. The number of visitors - one of the basic indicators that are the basis for calculating the total volume of services provided, the average length of stay, the volume of consumer spending, the revenues of tourism and recreational facilities

Ukraine occupies a leading position in Europe in terms of providing natural and man-made tourist and recreational resources that could potentially generate significant interest of local and foreign tourists. The development of tourism and recreation industry in recent years in the country as a whole is characterized by positive dynamics, increase in domestic and inbound tourism flows.

The structure of tourist flows in Ukraine is positive and shows significant prevalence of domestic and inbound tourism, which formed a total of 88.4% of all tourists. Thus, tourism and recreation industry in the country ensures the implementation of its main functions - creation of new jobs (including for vulnerable groups), increase incomes, increase revenue, reduce social tension in tourist and recreation areas, promotion of

related industries, investment activity in the industry to develop new tourism products and improve the quality of existing service offerings.

The presence of recreational and competitive travel products and services will satisfy the relevant requirements of the population of Ukraine, foreign citizens, increase the investment attractiveness of the recreational and tourist areas of the country to strengthen its image as a recreational and tourist center of international importance. Therefore, the gradual provision of recreation and tourism modern scientific and methodological support and highly qualified personnel will significantly enhance its profitability by increasing the number of entities, the volume of domestic and foreign tourist flows. The author explains the fact that the demand for recreation in nature all the world is growing rapidly, increasing non-defined habitat of modern man's physiological and psychological needs. For example, economic and statistical analysis of the World Tourism Organization shows that recent international travel and the income from them increased in all regions of the world (tab. 3.3). So, for 48 years (1958 to 2006) the number of tourists in the world increased 15.2 times and revenue from tourism increased by 133.6 times.

Source: * systematized and summarized her authors set forth the results of the study and analysis of statistical data.

Ukraine has a favorable geographical and geopolitical location, unique natural and climatic resources, historical and cultural heritage. Among health resources we note significant

reserves of therapeutic muds, which are almost all genetic types. In Ukraine, widespread and numerous mineral water spa of all types. Hydro resources widely and effectively used in the resorts of Transcarpathia, Lviv, Poltava, Vinnitsa, Ternopil and other areas. Healing climate coast of the Black Sea and Azov Sea, Crimea, Carpathians, middle zone countries are widely used as the basic medical and health factor in almost all resorts. Unique natural healing resources are the mines microclimate (Solotvyno salt mines).

So Witness: TRK Ukraine is a powerful socio-economic and political factor in the economy and politics of many countries and regions. In particular, Ukraine has great recreational resources that are used or could be used for recreation, tourism, medical treatment, rehabilitation population [26]. Changes in both material and technical base and organization of production and the social sphere of modern society is certainly affected the socio-economic role of recreation in the process of social reconstruction. Today, recreation affects not only the recovery of the labor force, but on the whole person. For the current stage of social development characterized recreation increasing role in the process of recuperation rights. It TRC and is the complex system in which the intertwined interests of many sectors of the economy, culture, safety, employment, development of tourist infrastructure, recreation rehabilitation. The most cultivation, development and improvement of the structure of recreational facilities is celebrated Black Sea region within which recreation is the leading sector of specialization. Favorable climatic conditions of the Black Sea area, numerous beaches, warm sea, curative mud and mineral water for various types define its national and international importance.

In the Odessa region are 43 and resorts to treatment, 16 boarding houses and rest, hostels and camps. All are in the Odessa recreation area. Leisure as a social phenomenon and its

place in the social sphere and environmental effects are not well understood by modern science. In this regard, studies in rekreatohiyi find opportunities to use and develop the resource potential of the Black Sea.

Tourism and recreation industry Zakarpattya past five years for all dynamic parameters, is active in investment activity, the number of visitors increased employment in the industry is actively developing green tourism, which is based on the performance of individual households. TRK this region represented mainly small and medium businesses. In recent years dramatically changed the structure of the form of ownership in favor of private schools. The region is gradually emerging tourist and recreational complex with two well-defined peak seasons - summer (recreation, rest, treatment) and winter (ski), each of which has certain characteristics provide services.

The dynamics of organized tourism flows in 2008 is steadily increasing, the structure of tourist flows dominated by domestic tourism, which is a positive development in terms of the impact on regional development, because it creates additional demand for accommodation facilities, food, transportation, travel, enhances the range of services and products of the tourism destination, increasing employment, increasing incomes of local and state budgets, stimulate investment in the sector.

The main branch of outdoor activities - hiking, which is the largest center of Lviv - a large railway, highway and air transport hub of international importance. Among other distinguished Pustomiti, Vynnyky Shchyrets, Obroshino, Old Village, Zvenigorod. Big resort of national importance is great Lubin. For the recovery is most suitable southeastern slopes and narrow band wasted Davydov strands. The main health centers in the region are Bryukhovychi Vynnyky, mineral Tags, David, Suhovolya, Glynn Navariya. Speaking significant

segment of services, TRC also relates to the field of intensive natural resources. Therefore, confirm that the state policy in the sphere of nature, including recreation and tourism, in a fairly active should regulate the development of recreation and tourism,

It is equally important to consider that anthropogenic pollution of natural resources and RTRK brings significant economic and social damage. [41] Unfavorable environmental conditions affect the performance of social development of the population throughout Ukraine as reducing the recreational potential of natural resources, unfavorable epidemiological situation and environmentally innovative food negatively affect the health of the population of Ukraine and its workforce. General health of the recipient pollution are aggregated indicator of blahopoluchnist any region in ecological terms. According to experts of the World Health Organization defined health status by about 50.0% lifestyle by 20.0% - environmental conditions and climatic factors, 20.0% - heredity and only 10 , 0% - health measures [105]. Note that in Ukraine today there is a trend of significant growth in the number of tourists visiting Ukraine for treatment to the overall reduction of their number [37]. These data confirm that demand for rehabilitation is growing rapidly, and thus increasing the demand for natural recreation resources. It follows the extraordinary relevance of their conservation, management and restoration, because their quality is the primary requirement for tourists and travelers. The need to preserve and further revival of natural resources and protection of recreational and tourist areas is relevant also in connection with the demographic situation in the country - the population of Ukraine continues to decline. in Ukraine today there is a trend of significant growth in the number of tourists visiting Ukraine for treatment to the overall reduction of their number [37]. It should be noted that the preparation for holding in Ukraine European Football Championship in 2012 (hereinafter - Euro 2012) was a significant impetus for the development of tourism. Accessible natural and cultural and lessons in preparation for the football championship Ukraine infrastructural capacity brings a new level of recreation and tourism industry. The main achievements of the preparatory process of the tourism industry for Euro 2012 is the reconstruction of airports, railway stations and transport sector, substantial building hotels and tourist accommodation alternative means, the emergence of street marking tourism and urban development and advertising information providing tourism and hospitality industry.

One of the main preconditions for the development of hotel industry in Ukraine is the creation of a favorable investment climate and finding sources of financing for the construction of new and reconstruction of existing enterprises. Following the results of 2012. in new construction and

technical upgrading of existing hotels and other places for temporary residence from all sources of funding invested 2579,4mln USD, representing 89.7% of 2013. The share of investments in the development of hotels and other places for temporary residence, developed in total investment was 1.1%. Among the regions of highest growth investments in the hotel industry Rivne (in 5.8 times more than in 2013) and Nicholas (2.4 times more) regions. In 2016. in Ukraine built 57 new hotels 2409mists. (Tab. 3.5).

Source: State Statistics Committee of Ukraine *, 2016.

According to the functional structure of the hotel industry enterprises in Ukraine, services for temporary accommodation in 2016. provided 838 hotels, 25 motels 5 hotel-office centers, 8 campsites, 50 youth hostels and mountain refuges, hostels for 189 visitors and 480 other places for temporary residence. At the same time there was a decline of hotels compared to 2013 in the Sumy region. - 6 units, Dnipropetrovsk - 5, Vinnytsya and Zaporizhya - by 2 units each, Rivne - 1 hotel. Reducing the number of hotels was mainly due to their complete elimination, sale or transfer individuals to rebuild housing.

In Ukraine, most hotels are located in the city. Kyiv (9.8% of the total number of hotels), Lviv (8.9%) and Dnipropetrovsk (7.0%) regions, Odessa (5.7%), Luhansk (5.2%) and Chernihiv (4.6%) regions, due to their high level of industrial development, the presence of centers of tourist flows / spa area.

Admittedly, the index of the hotels determined by the number of hotel rooms per 1,000 inhabitants. For Ukraine this figure in 2016 remained at the level of 2011 and amounted to 1.6 hotel rooms per 1,000 inhabitants, in hotel rooms Kyjevuv- 4.5 against 4.4 in 2013 more than the average for Ukraine was the availability of hotels 1,000 inhabitants; in Zakarpattia, Lviv, Odesa, Volyn and Ivano-Frankivsk regions indicator of hotel rooms fluctuated slightly compared to 2013 and ranged from 2.5 to 1.7 hotel rooms.

Minimum use of the capacity of hotels was in Kirovograd (0.18), Donetsk (0.19) and Ivano-Frankivsk (0,19) regions, while the maximum - in the city. Kyiv (0.50) ..

The decrease has taken place in most regions of Ukraine. Compared to 2013 total time visitors reduced rates m. Kyiv - to 465.9 thousand. Man-days Dnipropetrovsk region. - to 153.8 thousand. Man-days, Volyn - to 148.7 thousand. Man-days Chernihiv - to 95.7 thousand. Man-days and Odessa region. - to 93.1 thousand. Man-days.

Thus, despite wide "geography" of tourists who come to our country (in 2016 foreigners came to Ukraine from 218 countries to 205 countries in 2013), a third of their number (33.7%) were tourists from the States CIS - 339,3 thousand. people (Belarus - 48.5 thousand. people of Moldova - 17.9 thousand. people). For other countries, Ukraine is often visited by tourists from Germany - 81.9 thousand. People, Poland - 74.7 thousand. People, US - 67.0 thousand. People in Italy - 33.5 thousand. People, France - 32, 7 th. persons Turkey - 29.0 thousand. people, United Kingdom - 26.9 thousand. people, Austria - 21.1 thousand. people, Netherlands - 17.8 thousand. people, Czech Republic - 14.5 thousand . people in Canada - 13.9 thousand. people and Sweden - 13.2 thousand. people.

One of the most important characteristics as the hotel industry is also a comfort. The criteria for admission to certain categories of hotels is the quality common areas and rooms, availability of bathrooms and shower rooms, standard furnishings, types, quantity and quality of technical equipment, the level of processing facilities, the number and qualifications of staff; the level and range of services in nutrition. According to the national standard ISO 4269: 2003 "Touristic services. Classification of hotels "expected distribution of hotels and motels in five categories (from one to five" stars "). Today, according to standardization in Ukraine there are six five-star hotels, "Premier Palace", "Kyiv Sophia" and "Opera (Intern)" in the city. Kiev, "Donbass Palace" in . Donetsk, "Ukraine" in Dnepropetrovsk. and "Joy" in Odessa. The guest serving 51 four-star, 329 three-star, two-star and one-star, and the rest -

452 hotels - not rated. Such a large number of "uncategorised" hotels is due to a number of reasons: most of them do not correspond to a set of defined requirements for the effectiveness of management, logistics, nomenclature and quality of services, level of service; a number of hotels conduct current or capital repairs and reconstruction, or are in liquidation; newly built hotels have not been able to obtain category; a large number of hotels became the property of individuals who do not need to obtain a certificate "star" because it requires considerable financial costs. Note that the document regulates tourist activities The Law of Ukraine "On Tourism" from 15.09.1995, which determined the general legal, regulatory, institutional and socio-economic principles of formation and implementation of modern Ukraine's state policy in this area in the context of solving problems to ensure the transition regions of the country to sustainable development . At the same time recognize that is not yet developed and adapted in practice, not economic levers and controls their implementation in the context of sustainable development of the regions of the state.

3.4. Improving the socio-economic impact of tourism and recreation areas

The fundamental basis for ensuring and improving the efficiency of social sphere of recreation and tourism has become a state policy, focused on achieving important social goals and priorities. That the state should establish and define the overall strategy development, policy implementation and its precise mode of promoting economic recovery and recreation industry. It is a favorable market environment for socially efficient, economically viable and environmentally acceptable

development of recreational and tourism business should direct public policy.

Summarizing all possible policy options regarding recreation and tourism, there are two main types of [64]:

first - recreation, staying within sight of government and representative bodies, developing as a secondary field of activity, behind other sectors;

second - Recreation priority area recognized as a promising socio-economic development of clearly defined regarding its policies and program of action. It takes place adequately at all levels of management, through various forms of assistance to stimulate entrepreneurial activity in the field of recreation and tourism, attracting investment, including foreign ones. This recreation is considered in the broader context of development, significant social and economic targets which can be achieved by ensuring a proper level of infrastructure, training, environmental safety. In this case, it would give impetus to a kind of practical actions in other fields directly related to it are not.

We support scientific opinion [64], which is the second option should be a strategic line of public policy development of recreation and tourism in Ukraine. Recreation and tourism can be an important basis for sustainable human development, because it is having a strong social impact, significantly strengthened the appropriate public policy meets important social needs and achieve social outcomes. And these fundamental provisions should be the basis of the approach to understanding the role of recreation and tourism and areas of development [119]. State policy should be directed to the formation of such a market environment, institutional, economic and legal conditions which would promote business development in this area,

Recreation and tourism for the time of its existence became inaccessible to rest in the industry of public

entertainment and recreation for people of different levels all over the world. International tourism has become part of the economic and social development and one of the most characteristic manifestations of globalization [122, 123, 124]. Modern tourism and recreation is one of the most profitable activities of the world economy, dynamically developing. According to the World Tourism Organization and the International Monetary Fund, tourism from the late 90's of the last century came in first place and holds a leading position in world exports of goods and services, ahead of the automotive industry, chemicals, food and other industries.

Average growth rate of tourism are 7-9% per year, significantly higher than the average annual rise of the global economy. The scope of recreation and tourism distinguish the following factors: a small initial investment; short payback period and very high profitability of projects; growing demand for services. This successful development of tourism in the world due to socio-economic benefit derived by the development of domestic and inbound tourism, which:

- create jobs in tourism and adjacent areas (each tourist who enters the country, creating jobs 8-10);
- activates the development of hotel and spa management, transport and catering business, excursion and information services, tourism and entertainment, sports and recreational facilities and business centers;
- contributes to the inflow of foreign currency;
- encourage investment in the local tourism industry, ie increasing budget revenues;
- activates the upgrading of local infrastructure of transport, communications, etc;
- contributes to the preservation and restoration of historical and cultural and natural heritage of the country, regions, cities and towns;

- supports the revival and development of traditional folk arts and crafts, making souvenirs;
- promotes productive eco-oriented use of land that does not have agricultural value, which allows to preserve the natural flora on large areas, and also clearly demonstrates the great importance of natural and cultural resources for the economic and social well-being of society.

For many countries, international tourism has become the most profitable area of activity and the revenue from it - an important component of national budgets. Travel and tourism investment projects stimulate the development of the transport and hotel and tourism infrastructure (including airports, roads, ports, restoration of historical monuments, museums, development of natural protected areas), which increases the quality of life of the indigenous population and service tourists [29, 125, 126].

According to the report, the International Council of Travel and Tourism (World Travel and Tourism Council), in 2016 in this sector directly employed nearly 80 million people, or 2.9% of employment in the world economy and in adjacent areas of tourism - is about 225 million people (9% of the population of the planet) [125, c. 300]. By 2030 the number of tourist trips, according to experts UNWTO may increase compared to the current period three times [127, c. 35].

Our country is not yet among the world leaders in the number of visits by tourists. However, the features of its geographical location and topography, the climate, the wealth of natural resources, historical and cultural tourist and recreational potential of creating opportunities for many types of intensive development and domestic and foreign tourism. Currently, the recreation and tourism Ukraine there are 8.5 thousand. Companies, of which almost 3,9tys. - business tourism activities (licensing tour operators and travel agencies), more than 2.6 thousand. Hotels and similar accommodation

facilities, about 2 thousand. sanatorium and health institutions [74, p. 458; 85, p.5].

Enhancing the role and socio-economic impact of recreation and tourism should be the focus of public policy, implemented at different levels - macroeconomic, regional and local. Achieving social objectives of public policy has its own specifics, objectives, instruments and indicators at each level.

At the macroeconomic level conceptually important development strategy for the development of public recreation and tourism, which clearly formulates key socially important objectives and mechanisms to achieve them. At the meso level (regional level) declared goals and objectives specified based on the existing climatic resources and the existing infrastructure. Quite often happens in the world of asymmetric development of the various regions. For example, in Turkey coastal tourist regions highly and distant mountains are backward and unattractive to tourists with weak social protection and insufficient infrastructure.

Directly providing recreation and tourism services performed on micro issues that actualizes the definition of tourist destinations. Here are the available accommodations, meals, entertainment, provided a certain level of quality of services available transport, information, communication system.

Definition tourist destination indicates that it is "a physical space in which a visitor spends at least one night. It includes such tourist products as support services and attractions, and tourist resources Visiting along the road "back and forth" in less than one day. It has physical and administrative boundaries that define the shape of its management, and image and reputation, which determine its competitiveness in the market "[29, p. 65].

The implementation of socially oriented policy of recreation and tourism at the local level requires the

establishment of specific goals and corresponding indicators. In world practice has worked out development tools, system of indicators to manage the tourism sector from the perspective of sustainable development of the territory. The principles of sustainable tourism related to the use and division of spheres of the natural, socio-economic and cultural environment [128].

Providing high socio-economic impact of recreation and tourism requires an integrated approach taking into account cross-cutting effects of its operation at all levels. Implementation of programs of recreation and tourism industry is only possible through continuous and careful monitoring. Only under such conditions it will develop effective and sustainable.

In the 1990s the world have begun to develop a system of indicators to optimize the functioning of the city (Spain), regional development indicators (Chile), international environmental indicators, human development index and so on. In the same period based on indicators developed the first model of tourism and recreation areas (Malta, south of Australia, etc.) [129].

The proposed indicators include traditional rules of recreation and tourism (eg, capacity assessment areas) and new criteria of sustainable development at different territorial levels. These developments 90s served as a major impetus for the development of indicators of sustainable development of recreation and tourism.

In 1995-1996. The first technique produced with the use of indicators of sustainable development of tourist destinations. They were tested in Canada, USA, Mexico, the Netherlands, Argentina and other countries. Under the auspices of the World Tourism Organization held a series of meetings and seminars on the development and use of indicators [130]. According to the World Tourism Organization, the use of indicators of sustainable development of tourist destinations need to:

- adoption of optimal decisions about tourism development and reduce the risks of losses;
- prevent negative issues of tourism development in a particular area;
- identifying areas of tourism development;
- development of business plans and tourism development programs in the territory;
- risk reduction in the primary planning;
- increased responsibility for the development of tourism and involvement of the public;
- continuous improvement mechanisms for tourism development through regular monitoring of the state territory.

Thus, indicators of sustainable development of tourist destinations should be considered as the basis for the rise of tourism and at the same time as a tool for making decisions on priority directions of its development. Professionals working in tourism, always use indicators, some of which can be seen as related to sustainable development of tourist destinations.

The most simple of them is the amount of costs and revenues from tourism, the number of arrivals. However, the latter figure may be regarded as an indicator of sustainable tourism development only when it corresponds with the desired results and based on the determination of the maximum allowable capacity. Such phenomena as peak load, must be carefully evaluated, because it is not only the problem of using the number of rooms, but also excessive resource consumption (eg, fresh water).

Indicators can play the role of a certain degree of tension signals that allow respond to changing situations, criteria for assessing risk. Indicators for sustainable development of tourism destinations associated with the analysis of the impact of external and internal factors that determine the development of tourism. The main purpose - to

analyze the risks for the latest business travel and study area as a whole.

There are several types of indicators:

Prevention - indicators that reflect certain trends and warn of changes taking place in the "tourism - society - nature". These include, for example, are indicators of decline in the number of arrivals, length of stay of tourists in the territory of others;

tension - tension indicators functioning of this system and the presence of hidden conflicts as a result of using the tourist area (including water resources in the territory as a result of recreational and tourist development, rising crime on the territory).

measures - indicators that require definition: the current level of development of recreation and tourism and its place in the economic structure; measure the impact of recreational and tourism activities on the natural, socio-economic and cultural environment (for example, increasing the share of revenues from the development of recreational and tourism activities involved in recreation and tourism sector, changes in forested areas or areas of land used for recreational and tourism purposes etc); measure of management effectiveness recreation and tourism and the area in general (eg, evaluation of the current level of the ecological situation in the territory, evaluation of health of coastal and beach areas, increasing the number of regular tourists, lengthening the duration of stay in the territory, etc.).

Indicators can be qualitative and quantitative expression; but on certain indicators may not be comparable. For example, the number of arrivals can be measured in thousands of millions per unit time (per year). Value of domestic and international tourists expressed as a percentage, and temporary units are month, season and so on. The proportion may be considered as a measure of the current state

compared to reference values earlier data, etc. [131, p. 188; 132].

Particular difficulty during specific indicators and their comparison are qualitative indicators. For example, indicators that characterize the extent of satisfaction of tourists and tourists of their stay in a certain area, performance quality indicators adopted programs for tourism development. Development of sustainable tourism indicators - a complex and multi-step process (ext. S).

Basic methods of development indicators are in the gradual implementation. The final stage involves the formation of a final list of indicators used for the study area and planning of tourism therein. Let us examine some of the most difficult stages of the development of indicators of sustainable development and planning of tourism in the area. At the initial stage - research and organization - collected primary information about the area, analyzes the current state of tourism development on it. The question of boundaries tourist destination is ambiguous. It often contradict the political, administrative, natural limits to the principle of maximum assignment.

According to experts of the World Tourism Organization, tourist destination to be attributed to all areas and sites somehow related to the development of tourism. For example, you should consider the areas, where employed in the tourism sector workforce. In addition, the territory should be based on ecological boundaries. Of particular importance during territory borders with the so-called key areas that have a significant impact on the whole territory [130]. Thus, national parks, or therapeutic bathing-beach tourism and recreational centers spread its sphere of influence considerable territorial space [133, 134].

The main objective of phase - to formulate specific goals and objectives for tourism development in the territory

and determine its place in the economic sector. Initially determined desired indicators analyzed source of information is the collection of data and their initial analysis of the proposed indicators (as informed by public authorities and investors), then assessed the effectiveness of selected indicators and conducted their audit.

International experience demonstrates the feasibility of attracting as experts from different public and social sectors. For example, in Norway, in the planning and management of tourism development were involved: representatives of various public (social) groups (local NGOs, indigenous (ethnic) peoples); government agencies at the municipal, regional and national level; NGOs (environmental organizations and organizations concerned with the preservation of cultural and natural heritage, sports organizations, fishing, etc.); tourists, organizations representing the interests of domestic tourists; international tourist organizations and associations.

The choice of indicators of sustainable development of tourist destinations depends on the specific project objectives, priority areas of the territory. The initial list of desirable indicators is usually different from the final. The task of those involved in tourism management and planning of its development in a particular area is to reduce the number of indicators, leaving only the most relevant data and information provided. Thus, the initial list of indicators on the islands of Samoa includes 270 positions and only after careful selection it was reduced to 20 [135].

Number of indicators and their composition may vary as depending on the specific area, and the purpose of the study. Thus, the development of eco-tourism on the coast of Argentina, it was important to assess the whales in the Gulf, while the bathing-beach holiday - the nature of the coastline and the availability of natural beaches.

It should be noted that in some cases it is advisable to use indicators that can not be provided with accurate data, but reflect the seriousness of the problem. For example, monitoring water quality in coastal waters can be performed using not only the exact data of environmental services, but alternative indicators (number and nature of cases of skin irritation due swimming complaints to the state beach area, jellyfish off the coast, etc.). In this case, the use of such indicators is a catalyst (incentive) for additional research and find solutions to problematic situations.

Indicators of sustainable development of tourist destinations used at different levels - from local to global. For combination requires political part of the solution. In determining the strategic objectives of the region, namely the tourism industry should proceed to study the capacity threshold systems - natural, social, economic and cultural. In the tourism development area number and role of indicators may vary. Therefore, the development of indicators of sustainable development of tourist destinations and needs constant updating relevant databases. In the development may vary and primary objectives laid at the planning stage. Thus, the current needs of tourists forced to develop and make the market a differentiated product for which must be the material base.

To further study the conceptual aspects of improving the social impact of the operation of recreation and tourism should conduct a multifaceted diagnosis. It will be based on a range of factors that have a significant impact on the strategy of the study area (Table 3.1). This analysis is called REST-analysis, which is the instrument of strategic analysis far environmental organization [136, 137].

Table 3.1

* Source: [136, 137].

It is designed to detect Policy (Policy), economic (Economy), social (Society) and technology (Technology) aspects of the environment that may affect the strategy of development of recreation and tourism. The analysis of the political environment is important because it defines the general conditions of stability and security of the region or the entire country. The economic environment should be conducive to the implementation of various economic activities. Equally

important social characteristics of the population, which determine its readiness and ability to relax. Technology is an important component in the context of readiness for change in the region and meet modern technology requirements.

REST thorough analysis will help formulate more precise goals of recreation and tourism at national, regional and local levels. It is important that it was guided by social goals: the preservation and enhancement of moral and spiritual values of humanity, health, reproduction and ensuring conditions for preserving the environment. The development strategy of the tourism industry must focus on the protection of cultural and historical heritage, fight against poverty, the effects of climate change, prevent further climate change and environmental degradation, reduce the negative impact on it [138, 139].

The strategy of recreation and tourism should be considered:

- achieve European and global parameters value service quality and prices are based on systematic measures for standardization of service quality and economic incentives for companies to improve their;
- quickest possible adaptation of normative legal acts and legislative sphere of recreation and tourism to the standards adopted in the European Union;
- attracting foreign investment for infrastructure to service the recreational and tourist flows;
- transport, trade, communications, manufacturing products for use in the resort and recreational and tourist activities and services;
- creating an attractive tourist image of the region and promote regional tourism products to national and international tourism market;
- Development of logistics and infrastructure for recreation and tourism (modernization of bringing to the

international standards of logistics sanatorium existing health institutions and facilities of the tourism industry);

- commissioning of newly built recreational facilities through the development of economic mechanism to stimulate investment in this area;

- comprehensive approach to improving the quality of reception of tourists and travelers and service;

- bringing to the norms and standards of international hotel classification, certification host of other structures;

- bringing to the international organization and its restaurant business service;

- expanding the quantity and quality of recreational and tourism services provided;

- participate in the regional and European salons and fairs;

- organization of tours that will allow the best view offered products and evaluate the quality of reception;

- marketing execution system market recreation and tourism;

- creating favorable conditions for investment, tax and customs regulations of local, regional and national development;

- rational use and protection of recreational and tourism resources, creating programs and planning the future prospects of recreational and tourist regions in particular and the state in general [140, 141].

Strategy development of recreation and tourism can be defined as a set of solutions (system measures a set of programs) designed to study perspectives, priorities and areas of recreation and tourism, development and effective use of capacity, ensuring its dynamic and sustainable development. The strategy should combine the interests and activities of society, the government and the business sector to address prospective economic problems.

Conceptual framework strategy development areas recreation and tourism should include establishing primary objective and its components (sub) based on social, economic and environmental priority. Achieving the main objective - the transformation of areas of recreation and tourism into a powerful competitive sector of the national economy - should take place simultaneously with the achievement of environmental and sustainable human development. Only in such mutual unity and based on a highly developed infrastructure, this sector can be a powerful factor in GDP growth, employment and most importantly, improve all parameters of human development in the country [142, 143, p. 20-21].

Implementing this strategy through the establishment of a single governing body of recreation and tourism with the function of monitoring and coordination to ensure the management and socio-environmental and economic development sectors. At the initiative of a single governing body developed by national, regional and local development strategies of recreation and tourism [144, 145, 146].

Implementation of these tasks can be provided a set of the following measures:

organizational: Organization full statistical records of inbound and outbound tourism in a single governing body, its structural orientation; organization of regional and local tourist information centers for the purpose of information and analytical activities to identify priority objectives and targets of marketing policy, reservation services within the region and beyond, transportation, hotel, theater and exhibition tickets; stimulating the creation of new companies and the development of new tourism products;

investment policy authorities in the field of tourism: Attracting external capital loan secured by real estate and thus ensure investment in new facilities the hotel industry; allocation

of tax payments by enterprises hotel, the local budget as a guarantee fund providing loans to investment projects of hotel; direct involvement of foreign capital into the development of the hotel industry (training programs address new hotel construction, based on the analysis of objects that were hotels in the past, the possibility and expediency of their return in this area, preparation of regulations to ensure the legalization of targeted programs and mechanisms its implementation);

- *reconstruction and reorganization* of the existing hotel fund, preparation of a new hotel building. As the analysis of the loading of hotels and the forecast of future demand has shown, new construction is extremely important, since even bringing the entire hotel fund to the international requirements can not meet the growing demand;

- *infrastructure*: Organizational and financial support for local action for tourism; providing advertising and marketing activities in order to create an attractive image of the region; preparation of investment proposals feasibility study on the tourism sector and their advertising and information security; providing expert investment proposals region and technical assistance projects; financing of specific projects aimed at developing tourism and cultural sites in the region; development programs of industrial infrastructure hotel industry, including the production of goods dribnofasovanoyi products for hotels, development of processing capacity in regional farms to produce food products for hotels; analysis of the major tourist destinations, the development on this basis targeted program of restaurants, cafes and related facilities (souvenir shops, currency exchange, information kiosks); development program of transport companies that provide transportation of tourists; development measures (tax, administrative, etc.) to ensure the priority of the market of certified products and services.

In most countries tourism policy is conducted in the framework of regional economic development and is aimed at revitalizing the economy of the backward areas. As for developed countries, it is stimulating the development of tourism in the region is carried out by injecting capital into them and create centers of economic growth [147].

In our view, the government strategy of recreation and tourism in Ukraine should be based on continuous improvement of management of this area at all levels and clear orientation to achieve important social objectives: increase coverage of population and certain categories of recreational and tourist facilities, improving service quality, preservation socially protected segments of consumers, improvements in health and quality of life of the population as a whole.

SECTION 4

IMPROVING sustainable development strategy recreation and tourism in UKRAINE

4.1. The essence and importance of sustainable development recreation and tourism

Sustainable tourism development is based on the doctrine of sustainable development, which aims to change the relationship between man and nature in order to expand the opportunities for economic growth, and to create a coordinated global strategy for the survival of humanity, focused on the conservation and restoration of natural communities on the scale necessary to return to the limits of the economic capacity of the biosphere . The structure of the doctrine is a set of ideas, provisions and postulates of various sciences, which formed the basis of such UN documents as "Agenda for the 21st Century",

the conventions on climate change, the fight against poverty, etc. Sustainable development involves solving economic, social and environmental problems. Development will be sustainable only when a balance is reached between the various factors that determine the overall standard of living. The key challenges for sustainable development are:

1. Restoration and further preservation to the required extent on the necessary area of natural ecosystems and their ability to self-reproduction.

2. Providing at the same time a proactive solution to the problem: economic, social, demographic and spiritual development.

3. Harmonization of the rates of economic development with the economic capacity of ecosystems.

The Sustainable Development Doctrine is based on the Concept of Sustainable Development, which is based on the principles of sustainability of development processes, harmony of human development, social justice. The set of indispensable indicators of sustainable development determines quantitative and qualitative parameters and forms the scientific and theoretical preconditions for the development of a harmonious economic national and world economy. By definition, the UN key indicators can be grouped into 14 sections: poverty, governance, health, education, demography, natural disasters, atmosphere, land, marine water resources, fresh water, biodiversity, economic development, global economic cooperation, consumption and production patterns [2]. The sustainability of tourism development is a component of the development of national economies. Tourism should be developed so as to benefit the local population, strengthen the economy of the host country, creating new jobs. Tourism industry has great potential, which allows you to make a constructive contribution to the sustainable development of countries and regions,

In connection with this problem occurs methodological research potential regional links with the environment, the solution of which can promote the goal of improving management them for sustainable tourism. However, to date the problems of determining the relationships between different potentials and management of their properties has not been given sufficient attention.

Considering the structure of the potential of the region used in the field of tourism, should be allocated among them the key. Key capabilities include those forming and development which can provide sustainable operation and development of the region. These potentials are influenced by capacity needs, which dictates the degree of use of potential opportunities. The structure of total tourist potential of tourism development is shown in fig.4.1.

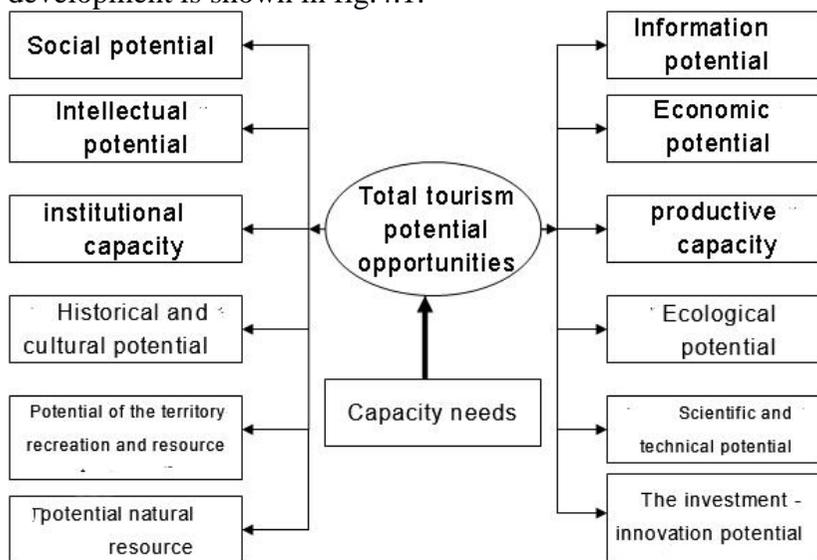

fig.4.1. The structure of total tourist potential of tourism

Presented in Figure 1 for regional potentials for tourism development is not complete, because their number depends on

the goals, methods of and achieve the necessary resources. Exactly potential needs of the source and the driving force of tourism in the region, it should be focused all other potentials. Obviously, the central element that creates the overall capacity needs are turysty. An analysis of the potential of the functioning and development of tourism provides a basis for imagining the region as a set of its potentials, as well as highlight the subject of tourism management. In our opinion, the subject of tourism management are the properties of potentials, the relationship between them, the directions of their use. It can be argued that the potentials of the region are a systemic concept. Sustainable tourism - is consciously supported the development, which is why the role of the state as soon as it is able to develop a strategic framework planning of the tourism industry. The feasibility of the transition to the implementation of sustainable development strategies Ukraine defined as internal factors and external related to the European aspirations of Ukraine and the need for compliance with international obligations of Ukraine. Against the backdrop of increased competition in the international tourism market, global trends to strengthen the role of states in the sustainable development of tourism, national domestic tourism product becomes less attractive and competitive. As a result, the tourism and resorts in the state is unable to ensure the full implementation of economic, social and humanitarian functions, is not conducive to preservation of the environment and cultural heritage, create jobs, increase the share of services in the GDP. For overcome these negative phenomena in Ukraine designed by

At the heart of the Doctrine of sustainable development is the concept of sustainable development, based on principles: sustainability of development processes, harmony of human development and social justice. The strategic goal is to develop

the concept prioritization of the industry that provides social and economic development of the region. Ways to achieve this

- research and evaluation of tourism potential of the region;

SWOT-analysis of the tourism industry and its infrastructure;

- formation of tourist image of the region;
- innovation and investment policies;
- the creation of material base of the industry.

Key components of sustainable development of tourism in the region shown in Fig. 1. Based on studies on sustainable tourism development and learning experience of countries proposed a set of methodological principles and approaches to the structure and content of sustainable development of tourism in the region. These include: comprehensiveness and integrity priority, concrete objectives, security legal framework

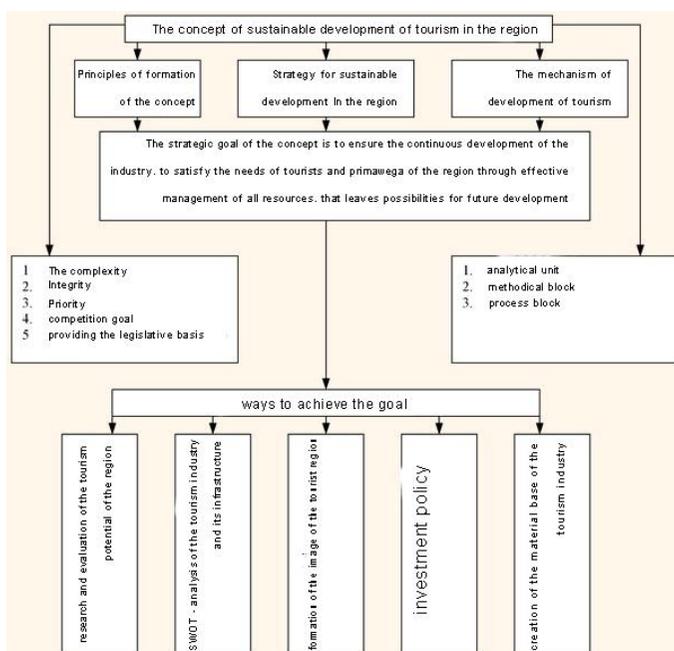

Fig.4.2. The concept of sustainable tourism in the region

The principle of comprehensiveness and integrity of the concept of sustainable tourism in the region provides,

Firstly, an integrated approach as a framework for implementing regional policy of socio-economic development, the definition of investment priorities or funding for economic reforms through investment approach to socio-economic sphere, all the elements are interconnected. It provides for inclusion in the policy of socio-economic development not only of production - technological aspects, but also social. The composition of elements of the regional policy of socio-economic development, including the development of sustainable tourism in the region must include scientific, technical, investment and innovative programs, training and retraining, social security workers.

Second, the coordination and interaction between the two components of policy - structural and investment. This relationship provides all directions and mechanisms of regional policy of socio-economic development. In the current context of limited resources essential in regional policy sustainable development of tourism has a its principle as a priority

The main obstacles to the development of tourism in the region is the economic, political and social instability. However, the development of sustainable tourism development in the region could increase much more inflow of tourists to the region, thus ensure the development of the sector and socio-economic development of the region. In the development of sustainable tourism development in the region in order to achieve optimal results it is important to consider the advantages and disadvantages of the region, as well as opportunities and consumer-tourist product. Given these

circumstances will correctly identify development priorities, the forms and methods of attracting investment and assess their volumes. For the realization of sustainable development of the industry greatly affects the overall economy of the region and type of existing production recovery

The next element of sustainable development of tourism in the region - a strategy for sustainable tourism development. The strategy should be based on priorities of industry-specific economic development of the region and its natural and recreational potential. The strategy proposed has a purpose, which consists in changing the sectoral structure of economic complex of the region and provides for the allocation of sectoral priorities for funding in the long term stages. Long term is not accidental. Sustainable tourism development strategies discussed in a one-off measures, as long as the doctrine of incorporation tourism regions in the global economic system as equal partners. In forming the concept of sustainable tourism development in the region and taken into account that the economy in many regions of Ukraine has a diverse character. The concept of sustainable tourism in the region includes a mechanism to ensure the industry. Tourism development policy is part of the business entity mechanism in the region, which can identify the main elements and link mechanism to ensure the development of tourism.

The sustainability of tourism development is part of the national economies of Tourism as a sector of the economy is in a complex interaction with the environment and so today, the task of further development of tourism is to reduce the negative environmental impact (pollution from sewage, waste, emissions of air transport, erosion of beaches due alignment of the coastal area, the impact on the culture of local people, loss of historical and architectural heritage, employment of minors, etc.). Governments must be adopted restrictions and regulations to minimize these negative effects. Tourism should be developed

so as to benefit the local population, strengthen the economy of the host country, creating new jobs. Tourism industry has great potential,

Sustainable tourism - is consciously supported the development, which is why the role of the state as soon as it is able to develop a strategic framework planning of the tourism industry. The feasibility of the transition to the implementation of sustainable development strategies Ukraine defined as internal factors and external related to the European aspirations of Ukraine and the need for compliance with international obligations of Ukraine.

Against the backdrop of increased competition in the international tourism market, global trends to strengthen the role of states in the sustainable development of tourism, national domestic tourism product becomes less attractive and competitive. As a result, the tourism and resorts in the state is unable to ensure the full implementation of economic, social and humanitarian functions, is not conducive to preservation of the environment and cultural heritage, create jobs, increase the share of services in GDP structure. To overcome these negative phenomena in Ukraine developed a strategy for sustainable development of tourism and resorts, which aims to improve the quality of life; protection of national interests of Ukraine in the field of tourism; the formation of a competitive national tourist product in the domestic and international markets based on rational use of tourism resources, preservation of historical and cultural heritage and ethnic characteristics of the Ukrainian people; creating conditions for tourism product consumption; Values assigned by the Constitution of Ukraine rights to rest, freedom of movement, employment, health care, a safe and healthy environment, spiritual needs and other rights in the implementation of tourist travel and leisure tourism activities; improving the legal, institutional and socio-economic principles of realization of state policy of Ukraine in the field of tourism

resorts and activities in the context of globalization and European integration of social processes. Ago, according to the Strategy of sustainable development of tourism and resorts in Ukraine, the priorities of sustainable development of tourism and resorts are: formation of a competitive national tourist product; development of human resources for tourism; saving potential tourism resources, the formation area of high tourist appeal in order to ensure efficient and effective use of tourism resources; formation of information space tourism; a unified system of marketing in tourism; deepening international cooperation for sustainable development of tourism forming area of high tourist appeal in order to ensure efficient and effective use of tourism resources; formation of information space tourism; a unified system of marketing in tourism; deepening international cooperation for sustainable development of tourism forming area of high tourist appeal in order to ensure efficient and effective use of tourism resources; formation of information space tourism; a unified system of marketing in tourism; deepening international cooperation for sustainable development of tourism forming area of high tourist appeal in order to ensure efficient and effective use of tourism resources; formation of information space tourism; a unified system of marketing in tourism; deepening international cooperation for sustainable development of tourism

The concept of sustainable development is based on five main principles:

1. Mankind can really provide sustainable and long-term nature, in order to match the needs of people living now, without losing the ability of future generations to meet their needs.

2. The restrictions that exist in the exploitation of natural resources relative. They are related to the current level of technology and social organization, and the ability of the biosphere to heal itself.

3. It is necessary to satisfy the basic needs of all people and all provide the opportunity to realize their hopes for a rosier life. Without this steady and long-term development is simply impossible. One of the main causes of environmental

and other disasters - poverty that have become common in the world.

4. It is necessary to establish the state of life of those who use excessive means (financial and material), the environmental capacity of the planet, particularly regarding the use of energy.

5. The size and growth of the population shall be consistent with global production capacity of the ecosystem of the Earth is changing.

4.2. The current strategy of sustainable development of recreation and tourism "Ukraine 2020"

Sustainable tourism - a stable coexistence of mankind and nature. At the beginning of 2014 Ukraine has entered a phase of reforming the old system, someone approves the changes, someone criticizes. But surely you can specify an existing plan that determines the direction and priorities of Ukraine till 2020. The plan called Strategy for Sustainable Development "Ukraine-2020", which was presented September 25, 2014 President of Ukraine Poroshenko. Development Strategy began in July 2014 with the invitation to the public to give their suggestions on vision development. A December 24, 2014 at its first meeting approved the Strategy National Council reform, which is a special advisory body of the President of Ukraine on strategic planning, coordination of positions on implementation in Ukraine of a single state policy reforms and their implementation. "Strategy 2020" covers social and humanitarian aspects: the aim is to Ukrainian living longer, trust courts proud of Ukraine, and young people know two or more languages. To bring all this to life Ukraine will have to exert all efforts, at the same time, economists noted that some indicators, the example of doubling GDP, reduction of public debt (from 67 to 60% of annual GDP) and entering the top 20

with ease business - is unrealistic expectations in terms of military conflict in the east of the state. Consequently, it must be said that the strategy was adopted in the most difficult period of our country. By their nature, "Strategy 2020" is an important reference potential changes in Ukraine, but in the implementation of certain tasks it is some resistance from the population and the authorities. However, the current use of natural resources Ukraine, including tourism, suffers from excessive anthropogenic load. It still has the imprint of past trends that have developed through the intensive use of natural resources. The concept of sustainable tourism development provides the tools and the ability to define a model of sustainable economic development that develops without asking questions about value priorities of today and tomorrow. "Strategy for sustainable tourism development should be based on the following principles:

- rational use and protection of natural resources;
- benign environmental conservation;
- legality in the implementation of tourism;
- to balance private and public interests in tourism resorts and activities;
- free development of entrepreneurship in the tourism sector in compliance with the limits loads;
- the balance of all the constituent elements of sustainable tourism development as socially responsible, environmentally effective and economically directed activities;
- The social dimension of tourism and resorts;
- Each free access to information in the field of tourism and resorts;
- sufficient good-quality services to meet the needs of consumers;
- security of constitutional rights of citizens in the field of tourism.

The above set of quality parameters sets a minimum level of protection of tourists and includes a set of basic consumer properties as safety, compliance with hygiene standards, accessibility, transparency and more.

The influence of the state on environmental, economic and social factors ensured through the reorganization of the system and change management mechanisms at the state and local levels, the introduction of strategic planning related legal, regulatory, institutional, scientific, methodical, financial support and more. This strategic planning in tourism is based on the strategy of socio-economic development, ensuring its thrust to improve the quality of life as the main indicator of evaluation of sustainable development. The main strategy for sustainable tourism development are:

- improving the quality of life; protection of national interests of Ukraine in the field of tourism;

- forming competitive national tourist product in the domestic and international markets based on rational use of tourism resources, preservation of historical and cultural heritage and ethnic characteristics of the Ukrainian people - creating the conditions for use of the tourist product;

- Implementation of the Constitution Ukraine secured rights to rest, freedom of movement, employment, health care, a safe and healthy environment, spiritual needs and other rights in the implementation of tourist travel and leisure tourism activities;

- improving the legal, institutional and socio-economic principles of realization of state policy of Ukraine in the field of tourism resorts and activities in the context of globalization and European integration of social processes.

Therefore, according to the strategy of sustainable development of tourism and resorts in Ukraine, the priorities of sustainable development of tourism and resorts are:

- forming competitive national tourist product;

- development of human resources for tourism - saving potential tourism resources, the formation area of high tourist appeal in order to ensure efficient and effective use of tourism resources;
- Formation of information space tourism - a unified system of marketing in tourism;
- deepening international cooperation for sustainable development of tourism

According to the "State Strategy for Sustainable Development" Ukraine-2020 "is to create conditions to improve regional competitiveness, ensuring their sustainable development based on modern technology, high productivity and employment. According to the "National Strategy for Regional Development until 2020" strategic objectives of regional policy by 2020, will provide dynamic balanced development of the whole country, to bring living standards up to EU standards and create conditions for greater economic activity in all regions of the country, should eventually alleviate regional disparities, reduce any risk of depressed areas and protect society from significant cost recovery belongs s conditions of their life. To diversify the economic activity of great importance to the development of tourism and various forms of recreation. Economic growth, structural changes in the economy and promoting international contacts contribute to the development of the service sector. In this important role played by natural and cultural features of the area. Tourism development, including agriculture, can be an important factor in the growth of employment, especially in rural areas. "

National Strategy provides for particular stimulating business development in the tourism sector, promoting the development and modernization of tourist and recreational infrastructure, improving the quality and competitiveness of domestic proposals on the world market of services in tourism.

At the same time, improve hotel services requires reconstruction and modernization of existing hotel base,

implementation of new technologies, create economic incentives to attract investment in the construction and operation of new hotels, which, from its part, requires significant investment.

The second strategic objective "National Strategy for Regional Development until 2020" is to ensure the development of human resources. Improving the quality of human resources is the key to the dynamic development of the country and its regions. The implementation of the policy of development will be based on regional characteristics of demographic situation, the level of employment and its life that contribute to job creation, provision of self-supporting SMEs.

The third strategic objective of the "State Strategy" is the development of regional cooperation. Overcoming disintegration tendencies and promoting consolidation processes at the regional level are mainly associated with the acceleration of economic growth, giving priority development of import-substituting production. One of the priorities is the development of cross-border, including Euro-regional cooperation. Public support will focus on the development of cross-border cooperation and international co operation and between the regions in the planning of territorial development. measures would be taken towards the development of tourism in the border regions, including the formation of tourism infrastructure, dissemination of advertising and background information.

The fourth strategic objective "State Regional Development Strategy for the period until 2020 is to create institutional conditions for regional development, including reforming the system of administrative and territorial structure by creating legal, economic and organizational conditions for the formation of local communities enforced material, financial and other resources sufficient for effective implementation of the tasks and perform the functions of local government, as

well as expanding the financial O-economic opportunities of local communities, strengthening the motivation of local governments to strengthen local budgets through the introduction of state-level social standards of public services regardless of location.

Regional development of recreational and tourist activities based software-tsilovoho approach. Regional recreation and tourism activity can be considered as the functional integrity, occupies a special place in the system of division of labor and provides essential health services to the public through its specialization. The most important indicators of regional development of tourism and recreation complex is justly considered its qualitative and quantitative characteristics. The practice of regional development of recreational and tourist activities requires a deeper understanding of the trends and patterns of organization; opportunities and limits the use of foreign experience. It provides methodological development and regulatory model of the target areas of activity based on the analysis of specific features and the most significant relationships. Carrying out such diagnostics enables depart from contemplative approaches abstract perception measurement trends and regional development of recreational and tourism activities. The need to take account of current trends and structural features of recreational and tourism activities in the region focuses on the use of program-based approach. The formation of market relations in Ukraine requires the development of scientific bases to adapt the concept of program-based approach to new conditions. This primarily concerns the definition of the necessary components of organizational and economic mechanism of application of program-based approach. These include the necessary components to priority activities together with a list of goals for solving complex problems of long-term development and evaluation of trends relevant solutions through targeted

programs. The function of government is to regulate, control, economic, legal and organizational support programs and projects. Development and implementation of regional programs of recreation and tourism activities is one of the most common ways of regulatory policy. Its components are the legal and administrative regulation through laws and regulations, standards, licenses, norms and standards focused on world market parameters recreation; financial and taxation, monetary regulation, regulation of prices and tariffs, investment policy. Development and implementation of regional programs of recreation and tourism activities is one of the most common ways of regulatory policy. Its components are the legal and administrative regulation through laws and regulations, standards, licenses, norms and standards focused on world market parameters recreation; financial and taxation, monetary regulation, regulation of prices and tariffs, investment policy. Development and implementation of regional programs of recreation and tourism activities is one of the most common ways of regulatory policy. Its components are the legal and administrative regulation through laws and regulations, standards, licenses, norms and standards focused on world market parameters recreation; financial and taxation, monetary regulation, regulation of prices and tariffs, investment policy.

Program activities should be formed on the basis of program-based approach. Each measure must be specific, to work toward this goal. Activities that require significant amounts of investment or financial resources, it is advisable to apply the general system of determining appropriate sources providing the necessary resources.

The purpose of programming is to create a highly developed infrastructure for recreation and to create such forms of nature that will ensure sustainable development of recreational and tourism activities in the region. Infrastructure provision of recreation and tourism activities in the region

involves the functions of regulation and coordination of economic processes. Generally, to form a competitive national economy requires that infrastructure ahead of the growth sectors relevant economic complex. In addition, it will form the infrastructure market relations in the field of recreation and tourism Nature and affect growth in the flow of tourists to the sites of natural and recreational potential.

For organizations adopting effective solutions to the regional development of tourism and recreation practices program-oriented planning and management, you need an orderly and complete information support. Based on objective information management functions can be carried out efficiently and effectively.

Creation of information system is intended to respond flexibly to changes in the development of regional recreation and tourism activities. Such changes in development trends related to the formation of recreational and tourist flows and regulatory impact of regional authorities. In order to adapt the information system to the specific situation must be considered features and principles of recreation and tourism, to explore the internal relationships and identify the relevant information on their implementation.

Sees what information support of program-oriented planning and management can be summarized as development strategies recreational and tourism activities in the region. Generally, the strategy of territorial development aimed at improving regional policy and implemented through several regional programs. The formation and implementation of regional development strategy requires determining the main goal, then develop goals to ensure its implementation. For each individual area defined activities in the field of state regulation of development of recreational and tourism activities generated variants achieve the main goal and assessed their priority. The regional development strategy is long-term with a clear

timeline certainty. The exact time depends on the proposed recommendations prospective period spent forecasting work. Depending on the level of intensification of program objectives implementation time span scientific advice continues or reduced. This affects the amount of costs provided for regional program development and results of the measures. Spatial processes of regional development of recreational and tourist activity in emerging market economies are characterized by innovative forms such as special (free) economic zones, especially Resort and suburban areas for recreation. Their establishment and effective functioning is ensured scientific development and implementation of projects and improving governance. Formation of European regions provides for the creation of organizational structures in the form of international associations, cluster organizations, consortia, free economic zones. The basis for the creation of innovative forms of regional development of recreation and tourism sector can be a national park. Obviously, cooperation within the framework of cross-border cooperation in the recreation and tourism activities should not be limited just outside the common border areas. Thus, the presence of international transport corridors implies the need to develop joint measures to control and modeling tourism flows outside the European regions. The basis for the creation of innovative forms of regional development of recreation and tourism sector can be a national park. Obviously, cooperation within the framework of cross-border cooperation in the recreation and tourism activities should not be limited just outside the common border areas. Thus, the presence of international transport corridors implies the need to develop joint measures to control and modeling tourism flows outside the European regions. The basis for the creation of innovative forms of regional development of recreation and tourism sector can be a national park. Obviously, cooperation within the framework of cross-border cooperation in the recreation and

tourism activities should not be limited just outside the common border areas. Thus, the presence of international transport corridors implies the need to develop joint measures to control and modeling tourism flows outside the European regions.

Formation of a joint marketing strategy to promote recreation and tourism involving Ukraine and neighboring countries to gain a foothold in international markets. This requires joint action on the field of market research, organizing advertising company, product policy formation, development of marketing and information systems, implement uniform service quality, creation of regional tourism and recreation centers. The implementation of the above priorities will create favorable conditions for further development of regional recreation and tourism, stabilize the socio-economic situation of businesses.

The peculiarity of the current stage of development management regionalization of recreation and tourism activities are increasing its value to the upper levels of management. Solving complex problems of regional development of recreational and tourism activities can only be done through proper choice of objectives and priorities of the Program on

The concept of program-based approach is used relatively long time and proved its usefulness and adaptability to changes in the situation in solving interrelated problems of regional development and association objectives, financial resources and efforts of a number of organizations.

This creates the need for an objective priority problems and challenges of regionalization, especially at the top, state-level management. At this level study conducted strategy, choice of priorities and target regional development of recreation and tourism, development of indicators and innovative forms of organization. The new concept of program-oriented planning "Ukraine 2020" and management is based on the fact that the plan is only defined priorities for recreation and

tourism activities listing the major problems associated with solving complex problems of long-term development. The main mechanism of program-based approach in the transition to market a set of problems Estimates of their decision through appropriate targeted programs. The function of government is to regulate, coordinate, control, economic, legal and organizational support programs and organizations proektiv. Dlya effectively address regional development of tourism and recreation practices program-oriented planning and management, must complete and orderly information provision. Based on objective information management functions can be carried out efficiently and effectively. At the initial stage of providing information using different information sources. This statistical and accounting, reporting individual departments and ministries, these expert assessments and the results of specially organized surveys. Consolidating document containing basic information necessary for the development and implementation of regional target programs can be a specially designed "Passport regional target program". Certification in systematization of regional development of recreational and tourism activities can be seen as a special method of accounting and analysis of potential, as well as various events and activities undertaken in the program-oriented planning and management. In order to adapt the information system to a particular situation, follow: implemented in the program-oriented planning and management. In order to adapt the information system to a particular situation, follow: implemented in the program-oriented planning and management. In order to adapt the information system to a particular situation, follow:

- justification goals and objectives of the problems to be resolved;
- determine internal communications and selection of information required for their implementation.

So determined the need for information and data flows are complemented by insufficient data and removed unnecessary. Then estimated the importance of different data determined on this basis the requirements for frequency, urgency and authenticity them established what data to which workers and in what time frame should proceed. The result of this work is the information model, which provides:

- develop metrics that provide an adequate range of problems of a quantitative assessment of the factors prevailing in solving specific problems;
- development of technology selection, processing, storage and transmission of data information system.

Review the information system of recreational and tourism activities as a result of the set of interacting elements necessitates consideration of the integrity of this "set", interdependence and interdependence properties of elements. Effectiveness of regional development of recreational, cultural, personal, political, economic, social components and the specific rights related to their use.

In conducting a comprehensive study of definitions and perspectives of regional development of recreational and tourism activities are the following steps:

- assessment of the regional recreation and tourism potential of the degree and possibilities of various types and forms of tourism;
- Measurement of flow of visitors in the region and their characteristics;
- research infrastructures and offers recreation and tourism in the region;
- identification and analysis of factors that shape the demand for recreation and tourism product of the region;
- assessment of the level of demand for various qualitative and quantitative values of these factors;

- research trends and changes in recreational and tourist use in the region, according to travel expenses.

Spatial processes of regional development of recreational and tourism activities in emerging economies such forms characterized by innovative rod as special (free) economic zones, especially Resort and recreational areas. Their establishment and effective functioning requires a scientific approach to development and implementation of projects and program management. The results of application of the scientific and methodological approaches developed recommendations for methods of enhancing the socio-economic benefits of recreational and tourism activities at local and regional levels, and identifies the type of target programs that most contribute to the improvement of the population. Development and implementation of regional programs of recreation and tourism activities - now one of the most recognized ways to achieve their goals of regulatory policy. Its components are the legal and administrative regulation through laws and regulations, standards, licenses, regulations and industry standards that focus on the parameters of the world market of recreational services; financial and taxation, monetary regulation, regulation of prices and tariffs, investment policy. The regional target program of recreational and tourism activities designed to facilitate its adaptation to new economic conditions by setting a number of objectives and developing appropriate measures of resources (natural, material, labor, financial) of the definition of performers and terms. Its components are the legal and administrative regulation through laws and regulations, standards, licenses, regulations and industry standards that focus on the parameters of the world market of recreational services; financial and taxation, monetary regulation, regulation of prices and tariffs, investment policy. The regional target program of recreational and tourism activities designed to facilitate its adaptation to new economic

conditions by setting a number of objectives and developing appropriate measures of resources (natural, material, labor, financial) of the definition of performers and terms. Its components are the legal and administrative regulation through laws and regulations, standards, licenses, regulations and industry standards that focus on the parameters of the world market of recreational services; financial and taxation, monetary regulation, regulation of prices and tariffs, investment policy. The regional target program of recreational and tourism activities designed to facilitate its adaptation to new economic conditions by setting a number of objectives and developing appropriate measures of resources (natural, material, labor, financial) of the definition of performers and terms. regulation of prices and tariffs, investment policy. The regional target program of recreational and tourism activities designed to facilitate its adaptation to new economic conditions by setting a number of objectives and developing appropriate measures of resources (natural, material, labor, financial) of the definition of performers and terms. regulation of prices and tariffs, investment policy. The regional target program of recreational and tourism activities designed to facilitate its adaptation to new economic conditions by setting a number of objectives and developing appropriate measures of resources (natural, material, labor, financial) of the definition of performers and terms. regulation of prices and tariffs, investment policy. The regional target program of recreational and tourism activities designed to facilitate its adaptation to new economic conditions by setting a number of objectives and developing appropriate measures of resources (natural, material, labor, financial) of the definition of performers and terms.

Program activities should be formed on the basis of program-based approach. Each event must be specific to work on to achieve the purpose of the sphere. Activities that require significant amounts of financial resources or investment should be made in the general system of determining appropriate sources to provide the necessary resources [95, p. 67]. Its goal - creating a highly recreation and tourism infrastructure based on existing recreational resource potential and provide quality services to tourists. This requires solving complex issues,

including: ensuring the priority development of recreation; improvement of legislative, institutional regulation management system; creating conditions for revival of investment activity. The program must provide for the implementation of the following key measures: improving the management of recreational and tourism activities in the region; building and reconstruction of recreation and tourism infrastructure; scientifically grounded efficient use of recreational resources and infrastructure; formation of highly qualified personnel, to ensure conditions of training and retraining; Good organization of information and advertising using advanced technology and marketing with appropriate scientific - methodological support.

The content of the regional development of recreation and tourism, obviously, should focus on:

- identifying problems recreation and tourism activities as a priority sphere of life in the region;
- selection and justification of the system of strategic and tactical objectives, identify effective ways of proceeding recreational and tourism activities in the region;
- Priority selection of innovation and investment projects aimed at ensuring effective recreation and tourism and the preservation of the environment in the region;
- system of reasonable measures to involvement of domestic and foreign investors to implement sufficient goals to meet the needs of recreational and tourist services;
- creating operating systems monitor the implementation of reasonable measures to attract investment and efficient use of resources.

Strategy for regional development of recreational and tourist activities involves a multidimensional analysis of the state and definition of prospects for the use of the potential of the tourist region, its main subsystems. At the first analytical stage of the research, the main characteristics of the potential,

factors of influence and interaction of specific processes are revealed, then trends of development and determination of the conditions under which its use will be optimal.

Domestic practice of management of regional development of recreational and tourist activity requires a deeper understanding of the trends and patterns of its organization, the possibilities and limits of the use of foreign experience. This involves scientific and methodological development of normative and target models of the given sphere of activity taking into account the analysis of specific features and the most important interconnections. Such an analysis allows us to move away from contemplative approaches, abstract perceptions of trends and changes in the regional development of recreational and tourist activities.

The peculiarity of the current stage of regional development of recreational and tourism activities is to increase the value for the upper levels of management. Solving complex problems of regional development of recreational and tourism activities can only be done through proper choice of priorities based program. These priorities are as follows:

- creating an extensive structure of tourism;
- improve the quality and expand the range of tourist services;
- Reconstruction and modernization of existing tourist facilities, design and implementation of new construction;
- concentration of funds and resources for tourist facilities;
- active involvement of the private sector in tourism business;
- search for optimal forms of attracting domestic and foreign investment in tourism;
- support state-level domestic and foreign (inbound) tourism;
- Forming of business initiatives and their expertise;

- study international tourism market, business activity and specific proposals of foreign partners;
- active formation of highly skilled corps in tourism;
- establishing a strong domestic tourism product advertising, high-quality information and reference material;
- continuity and consistency of tourism education for different age groups of citizens at all stages of their life;
- taking into account the interests of various population groups in the development of tourism development programs;
- determining the independence of all actors tourist enterprise, equality of rights for state support;
- creating favorable conditions for domestic and foreign investors in tourism.

The implementation of the above priorities, create favorable conditions for further development of tourism, stabilize the socio-economic status of the subjects of recreational and tourist businesses.

4.3. Organizational-economic mechanism of recreation and tourism in the context of sustainable development

The system of government tourism in Ukraine based on the specifics of the national economy and world experience of regulation of relations among the subjects of the economy. Analysis of the historical development of the tourism industry and the conditions of the various forms of tourism shows that Ukraine has enormous tourist resources that can be used both in domestic and in entry tourism.

Formation of state regulation of tourism due to the need to identify the values and specific features of policy implementation, tactics and strategies in public administration.

Development of tourism governance in Ukraine clearly demonstrates the autonomous nature of this area. The main

objectives of state regulation of tourist activities include: ensuring citizens' right to rest, freedom of movement in tourist activities; environmental protection; creating conditions for activities aimed at education, education and recreation tourists; development of the tourism industry, providing economic situation does not allow full-scale and develop tourism

An important task of activating areas of recreation and tourism is to improve the organizational and economic mechanism - combination of forms and methods by which the organization of social production in the rest, consistent economic feasibility of its business as a whole, funding sources defined regulatory measures. Organizational-economic mechanism should be based on a set of short - and long-term regulators use them depending on the socio-economic situation of the country.

Organizational-economic mechanism is to enforce such practical problems:

- the creation of innovative management development recreation and tourism sector through a combination of centralized and decentralized models facilitating the establishment of vertical and horizontal management relations;

- optimization of the territorial organization of areas of recreation and tourism based on the criterion of increasing socio-economic efficiency of its operation;

- scientific and reasonable standards for levels of service tourists, including through the introduction of and compliance with the standards of funding and logistics segment non tsiyeyisfery;

- study urban design standards that take into account future needs of the population and visiting tourists in the area for recreation.

The structure of the organizational and economic mechanism of regulation of the provision of recreation and tourism should include three main subsystems:

- State regulation at the national, regional and local levels, which includes a mechanism of fiscal, credit and price regulation;

- self-regulation, which focuses on maximum use of internal resources of enterprises of recreation and tourism, interaction with the market environment, reflected in turn in the contours of the financial management of free market pricing and competition;

- Regulation of public influence on decision-making, providing control over the quality of services and use of the environment.

Certain types of organizational and economic mechanism gives shape to the inherent social-oriented economy and combines elements of state regulation of self-regulation abilities. The process of improving the organizational and economic mechanism needs assessment comparing the current state and forecasts for areas providing recreation and tourism, including available and needed resources in the future. This allows you to define a set of structural measures to enhance the development of recreation and tourism.

To improve governance development of recreation and tourism becomes necessary implementation of organizational and economic mechanism. Its components are subsystems that contribute to the regulation of some areas of recreation and tourism activities. One of the practical measures proposed establishing an association of tour operators ecological zones. Create NGOs contribute to image areas with valuable health and medical resources and increase the number of visitors.

The basis for the formation of recreation and tourism oriented development of certain areas should not only economic but also social and cultural orientation of society. Therefore, the availability of recreational resources is an essential prerequisite for the development of recreation and tourism, but also the political will to guide their development in

the social, cultural, educational, environmental and other objectives of human development. In terms of forms of organization, subjects recreational activities can be individual entrepreneurs, small and medium businesses, large (including international) travel agencies. Wide-scale enterprises this sector can operate on the basis of different forms of property: private, shareholder, state, mixed (public-private, public joint stock etc.). With position control subjects all recreational sector perform independent activities, but within a single state policy development. Therefore, to solve complex problems and scale formation and operation of recreation and tourism requires a clear organizational and management structure of all levels.

Summarizing the above approaches to structuring recreation and tourism industry, one could argue that all forms of spatial organization of recreational activities and various types of functional hierarchical levels considered as territorial and economic entities that are characterized by a triad of interrelated elements: a territory (recreational resources of natural and anthropogenic) tourists, including the release of the local population (carriers demand for recreational services) and recreational entities Entrepreneurship, Islands and recreational complex, industrial and social infrastructure (exponents offers recreational services) [18, p.5].

It should be noted that the concept of tourism is traditionally regarded as a commercial economic phenomenon. In contrast to this approach, Recreation seen more resource aspect as an object of national management and use. Currently, there is need for a more integrated approach to the synthesis of understanding how nature recreation and tourism, that is the only area of healing and restoration of human vitality and content of social and economic aspects of this field, because it is inextricably linked to economic activity, employment levels revenues, the contribution to GDP and so on.

With the growing commercialization of recreation and the dispersal of duties in the recreational and tourist area between public and private structures, the convergence between tourism and recreation in the area of theory, activities and influences intensifies. At the same time, recreational and tourist resources should be considered comprehensively for different types of leisure activities.

Thus, recreation and tourism offer great opportunities for restoring the health of the population, enriching the person with natural, cultural, historical and social values of not only their country, but also the whole world. In this case, the study of social aspects of recreation can occur from the point of view of holidaymakers and holiday organizers. If for the first recreation is considered primarily from personality positions, then others - this is the time to form and operate activities aimed at providing recreational needs of the population.

Recreation and tourism fulfill socially important and necessary functions - maximum satisfaction of the needs of the population in the improvement, treatment, rest, spiritual and physical development.

The state's social policy should focus on improving the population of the country by maintaining a network of state sanatoria, providing sanatorium treatment to citizens affected by natural disasters, accidents and other categories of people in need of state support. On the other hand, it is necessary to take into account economic goals to strengthen the economic potential of this sphere and increase its contribution to national income. Therefore, the purpose of its development should also be to meet the demand of the population and foreign citizens for rest and spa treatment in conditions that satisfy the most demanding needs (luxury apartments, a wide range of medical services, developed entertainment, etc.).

The recreation and tourism sector is an important part of the national economy, combining the extensive system of

recreation and tourism establishments, infrastructure enterprises and other related industries with close industrial and economic ties, jointly using resources to meet the various recreational, educational, cultural and other needs of the population. This sphere as an integral part of the way of life of a person should become one of the determining factors of socio-economic development of our country in the long-term perspective.

The current unsustainable patterns of production and consumption should be replaced in favor of our future prosperity and well-being of our descendants. The basic document that defines the essence of the new paradigm of human development, the materials of the conference in Rio de Janeiro 1992. According to these materials, "sustainable development" - is a development that satisfies the needs of present generations without causing harm to the ability of future generations to meet their own needs. In other words, the rate of use of natural resources by mankind should not exceed the speed of updating. Our descendants have the same rights as we do for natural resources and ecosystem functions. This definition is perceived in most cases as canonical [105]. From the standpoint of the theory of building sustainable (sustainable) development can state

The principles of sustainable development require both theoretical development and finding adequate resources to carry out its tasks. Sustainable development - a complex and voluminous category, which is the basis of a certain way of seeing reality and reflects a new phase of social subsystem of the biosphere. Go to the path of sustainable development - a complex, multifaceted process that is only possible on a planetary scale, covering all areas of human activity. In fact, it is a strategy for human development at the center of which raises fundamental scientific problem of a harmonious interaction between man and nature. The ambiguity of interpretation of the term "sustainable" generates various

phrases from filling their different contexts in terms of EPS functioning, "sustainable movement," "sustainable development," "sustainable economy", "sustainable society" "Sustainable nature" and so on. Today categories of the concept of sustainable development has not yet developed. Only recently begun trying to discover the meaning of certain concepts in their specific use. We have developed a paradigm formuvannya sustainable development in Ukraine, which operayetsya on basic factors: natural conditions; economic potential; mentality and policies (Figure 4.3.).

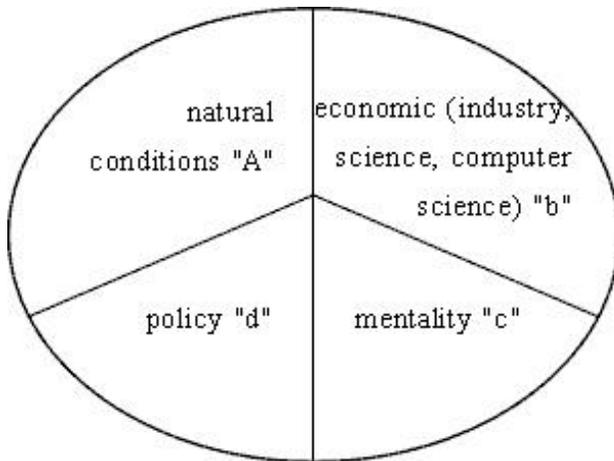

Fig.4.3 basic factors of sustainable development in Ukraine

2949/5000

Ukraine declared the necessity of transition of socio-economic sectors to sustainable development, which would ensure a balanced solution of socio-economic problems, problems of preserving the favorable environment and natural resources potential in order to meet the vital needs of present and future generations. due to the basic factors: natural conditions; economic potential; mentality and politics. Consider essentially the constituent factors. Factor "a" - natural conditions Soil and climatic conditions of most regions of Ukraine are favorable for conducting effective agriculture. In general, the natural conditions in our country are favorable for the formation of a stable agrosphere. Paradoxically high (30-50 centner / ha) winter wheat crops in many farms in 2013, even in those where in recent years almost did not bring mineral fertilizers, testify to this. Significant potential can also be exploited by reducing fertility.

Factor "b" -economic potential. He is currently in crisis, but there are conditions for his revival, and some changes have already occurred in 2013-2015years. There are still quite powerful and efficient enterprises, highly skilled engineers, infrastructure (power grid, nuclear power, main water channels, gas and reservoirs, roads, computer science, etc.). That is, there are previously created objective conditions for economic

development.

Factor "c" is an entity. Its formation depends to a large extent on the level of education and science. The education system that existed in Ukraine in previous decades provided a fairly high level of knowledge for the development of the latest ideas and technologies. Extremely important factor is the presence in Ukraine of rather powerful scientific potential. Only in Vinnytsia region on 01.01.2016 there were 208 doctors of sciences and 1465 candidates of sciences. The factor «d» is a policy. This is the most acute problem for Ukraine. No war or element has caused so much damage to our economy, in particular to the agrarian industry, as the plunder of state property and corruption. But, it seems, society has already begun to understand that it is impossible to continue this way. It is sad that a political factor, the ordering of which does not require any investment or resources, but only goodwill, has become a major obstacle in solving the problems of economic development. For Ukraine, the problem of sustainable development of nature and society, rational nature use is particularly relevant in view of the following factors: the concentration of high-intensity industrial and agricultural production in a small area, the use of significant natural resource potential, high population density, a constantly growing transport interconnections and war on south of Ukraine

Of course, economic development and exploitation of natural resources of society leads to considerable strain as soil erosion, water depletion, loss of wildlife, agrochemical poisoning the soil, water and air pollution.

In our view the key Sustainable development in Ukraine is the ability to ensure the conditions of the human species and structural unity can be presented as components of sustainable components (subsystems) - ecological, industrial and social, which are always interrelated and interdependent

and able to provide the conditions for human development. Spotlight - a man raising his life, creating favorable socio-economic and spiritual conditions for its cultivation (Fig. 1.1.).

The structural model allows us to treat the environment not only as an environmental factor of production, but also as an element of its results and its functioning. Social production in the context of sustainable development is not only the production of material goods, but also elements of nature, the natural environment, human habitat. That is, the playback environment is an integral part of recreation and tourism and Sustainable development in Ukraine.

Recreation and tourism is the area of flexible forms of employment as a result of their reduced unemployment and social tension. Because health effects reduced morbidity, increases vitality working, which generally increases the total fund of working time [23, p. 67]. In addition, recreation and tourism is a specific form of economic activity that meets the demand for health and tourism services, and also affects the intensity of other industries (light industry, agriculture, handicrafts, etc.).

CONCLUSION

Providing socially oriented character development of recreation and tourism needs first transformation mechanisms of state regulation on strengthening their social and environmental component. Development and strengthening of the economic potential of recreation and tourism can be a significant factor in the stabilization and economic

restructuring, deepening of globalization, intellectualization and informatization of society. In turn, the development of the national economy will be accompanied by rising real incomes and their spending on leisure and recreation.

However, the impact of public policy on the social consequences of the operation areas can be studied not only indirectly (by improving the general conditions for economic development). State regulation of the economy in general, and recreation and tourism in particular can and should provide important social objectives and mechanisms. All priority areas of recreation and tourism (creation of multichannel financial security, efficient use of resources, recreational nature, stimulating market resort and recreational and tourist services etc.) Are guided more coverage recreation and tourism services, rehabilitation, to improve performance health and life expectancy, human development in general [36, 172].

It is therefore extremely important and necessary is the environmental component of public policy, which aims to achieve environmental security, overcome the negative effects of tourism, sustainable development of territories of Ukraine. Accelerated development of recreational and tourism activities in the region in recent years has, along with the positive and negative effects, in particular there is an overload of infrastructure destroyed habitat disappear rare species of plants, changing habitats of animals, worsening air quality, clogged area that affects their health status. The negative factors affecting the environment include: the construction and operation of infrastructure (recreational centers, hotels, tourist centers, restaurants, bars, parking lots, gas stations, Maintenance points) is the most valuable and the most attractive places - in the recreational areas and tourist centers; the development of these types of recreation and tourism, as short-term meetings and games in nature (typical suburban zones occur on weekends and often massively, although it is

not very long), disorganized car -, mototuryzm on the road, riding motor boats; irrational use of natural medicinal resources (acute, particular problem is the preservation of the beach areas of landslide and shore protection works), lack of effective state control over their use, including commercial structures [173]. a short-term meetings and games in nature (typical suburban zones occur on weekends and often massively, although it is not very long), disorganized car -, mototourism on the road, riding motor boats; irrational use of natural medicinal resources (acute, particular problem is the preservation of the beach areas of landslide and shore protection works), lack of effective state control over their use, including commercial structures [173]. a short-term meetings and games in nature (typical suburban zones occur on weekends and often massively, although it is not very long), disorganized car -, mototourism on the road, riding motor boats; irrational use of natural medicinal resources (acute, particular problem is the preservation of the beach areas of landslide and shore protection works), lack of effective state control over their use, including commercial structures [173].

Thus, the immediate task is the efficient use of natural resources through well-balanced regional recreation and tourism activities in harmony with the needs of tourists and travelers, on the one hand and the natural environment - on the other, helping to both preserve the environment and sustainable development of recreation and tourism.

Environmentally sustainable development of resort and recreational areas and tourist centers has become a reliable basis for the rights of citizens to health protection, medical care, recreation, safe and recreation environment. Ecology and recreational use of the existing potential, the level and characteristics of recreational and tourist activities in Ukraine and its regions give reason for the future development of recreation and tourism.

Improving the socio-economic situation in our country is possible only through improved public policies, its new quality. Must clearly state position on key goals and objectives of the country. Require strong policy on broad parameters of socio-economic development, social services, recreation and tourism, their implementation and enforcement. State regulation of the economy, as the experience of advanced countries should be based on a strong state power, public order and national priorities.

On the other hand, for the formation of a strong economy (including powerful sphere of recreation and tourism) also need active motivated by economic entities. Redistribution of powers, resources, capital and profits is an important prerequisite for effective institutionalization of market activity in terms of thought-focused regulation. The extent of state influence on the economy is not constant, it is enhanced or diminished depending on the state of the economy, the impact of global factors and other social tensions. Historical experience shows that the creation of normal living conditions in the economy of finding the optimal balance between government regulation and activity of business entities [174, p. 25, 332-333].

In our view, this task is to achieve the optimum ratio of these mechanisms of action, government regulation, market forces (supply and demand), a public-private partnership and mechanism of local government.

Only if constructive and guiding of the state possible way out of the crisis, improve the socio-economic efficiency and competitiveness of the economy. The state should set priorities in accordance with the values and goals of society, provide adequate relation to real life country mechanisms to support them.

Basic principles of state regulation of recreational and tourism Ukraine should be as follows:

promoting tourism activities and create favorable conditions for its development;

identifying and supporting the priorities of tourism;

forming an idea of our country as conducive to tourism;

maintenance and protection of tourists, tour operators, travel agencies and their associations.

The priorities of the domestic sphere of recreation and tourism should be the support and development of domestic, inbound, social and amateur tourism without diminishing the value of other types of tourism and recreation, but stressing the importance of their priority position with both economic (employment growth, incomes GDP) and social (improving health, living standards, support spiritual and patriotic values) results.

The key social development goals of recreation and tourism activities in the country are:

ensuring citizens' right to rest, freedom of movement, etc. when making travel;

environment protection;

improvement in the coverage of the services of health and recreation and human development in general;

further development of recreation and tourism-oriented needs of the population on health and rest, while creating new jobs, increasing income levels of the state and citizens, deepening international cooperation, protection and preservation of recreational and tourist resources, effective use of natural and cultural heritage.

The most important part of state regulation of recreation and tourism are the direct involvement of the state in building a culture of recreation and tourism - the quality of all recreation and tourism, which should be characterized by a high level of public relations in the sphere of individual and social consciousness in tourists and tourists, officials government officials, employees of the tourism industry and recreational

facilities, the population of host of recreational and tourist regions. Culture Recreation and Tourism - an understanding of all subjects recreation and tourism role and place of recreation and tourism in the modern world, the need to develop a social model behavior rational use of free time for therapeutic, recreational, cognitive, physical training and sports,

An effective means to achieve these and other important goals of recreation and tourism in Ukraine can become a mechanism of public-private partnership. Institute of Public Private Partnership in all its variety of forms of display enables to combine interests, provide benefits and achieve the main goals of various subjects [117].

Despite the fact that the interests of the state, businesses and people in the tourism industry in different planes, but in fact they coincide in many positions. State interest primarily associated with the development of domestic and inbound tourism that achieves many economic and social objectives.

The economic objectives of the State are:

- GDP growth (national) product;
- direct, indirect and cumulative effect of macroeconomic (the sum of direct, economic multiplier effects, the effect of increasing income) derived from tourism services and products;

- the multiplier effect of tourism;
- Employment growth in the expansion of recreation and tourism and related infrastructures.

Social objectives are increasing:

- the average life expectancy;
- productivity and efficiency of the population;
- quality of life;
- social and intellectual capital;
- the number of displaced people within the country by region for business, recreational and entertainment purposes;
- and general cultural level of the population;

- patriotic spirit of the nation and the quality of knowledge and local history as a whole, and forming an idea of his native country population and improving its image in the international community.

Interest is always business profit, while social objectives can not be at all. On the basis of public-private partnerships and in cooperation with the state emerging social business focus. Capacity investments for long-term placement guarantees, ensuring risk-sharing project with the state, the choice of projects participatory guaranteed state support of the business.

The interests of the population in the tourism industry are as following:

- obtaining affordable health and recreation for all citizens;
- ensuring the civil rights of the population on health, recreation, leisure;
- quality assurance recreation and tourism;
- choice of recreation and tourism services and products of different levels and cost;
- Information availability and awareness of offers in the market of recreational and tourist services;
- opportunities and access to benefits and subsidies for health, leisure and travel services;
- presence of feedback from service providers to address the problems arising from the use of recreational and tourist services.

The development of public-private partnership in the tourism industry in the implementation of partnership projects involves effective use:

resources - land and natural resources; property complex, including infrastructure; tariff policy and state regulation of the economy; trust funds, including the tourism industry tax base; system and the scope of controls; information resources; customs and migration policy;

Resources Business - entrepreneurship; management financial decisions; labor, management, production, innovation and intellectual resources;

Resource people - civic initiatives; savings.

Effective public-private partnership needs to improve its own state regulation in the field of tourism, such as:

1. Legal regulation of recreational and tourism activities is as follows:

- improve the mechanism of financial support responsibility of tour operators, including increasing the size of financial support;

- tour operators increase legal liability for damages to life and health of tourists and other violations of law;

- Compulsory certification of instructors, guides, guides, guides and interpreters;

- defining features of legal regulation tourists traveling minors, the introduction of additional measures to enhance their security;

- the creation of a single body with the authority to tourism of a public register of organizations in this area;

- forming the legal basis of functioning unified automated information accounting system implementation of the tourism product in Ukraine;

- improving the regulatory framework for the development of cultural tourism;

- Compulsory insurance costs tourists traveling abroad and tourist routes increased risk in Ukraine.

2. State support of social and inbound tourism, provided:

- create conditions for the expansion of tourism and service infrastructure in the areas of historical and cultural city and other regions of Ukraine, including the formation of cultural and tourist zones, including historical monuments and cultural facilities maintenance;

- tax support development tool of tourism (children, youth, the poor, the elderly, etc.), by introducing social tax on income of individuals when paying for travel costs within Ukraine;

- a substantial increase in budgetary allocations for promotion of domestic and inbound tourism in Ukraine, including recreation areas and tourist centers as well as to attract investors in them;

- formation of a network of representative single body to manage tourism and recreation abroad to promote Ukrainian tourist product;

- the development of institutions of public-private partnership concession as objects of tourism and recreation special economic zones, clusters [176, 177, 178].

3. Improving the security of tourism, which provides:

- legally enforceable mandatory insurance of tourists traveling abroad, the definition of a minimum set of risks and insurance services included in this type of insurance;

- creating legal mechanisms to provide legal and other emergency aid Ukrainian tourists, trapped in a difficult situation abroad, develop order financing consular services to provide them with necessary assistance;

- Single open representative governing body of the tourism and recreation abroad that perform the functions of the emergency aid Ukrainian tourists in foreign countries (with consular services);

- develop and implement a set of measures aimed at improving the safety culture and leisure [179].

4. Crisis support recreation and tourism Ukraine, which carry comprehensive and include the creation of the most favorable political, economic, organizational, personnel and other conditions of its development in a situation of economic crisis.

One of the most important ways to achieve state goals is to develop and implement programs for the development of tourism. Through macro-economic and regional policy, the state contributes to a favorable environment for economic activity in the public interest. In the case of each region of Ukraine is characterized by acute problems caused by imperfect structure of production and resource potential mismanagement.

State regulation of social and economic development of the national economy must focus on the efficient use of natural resources, taking into account social and economic problems of the population [180, p. 84, 124, 132-135; 181]. By introducing mechanisms of public-private partnerships and strengthening the autonomy of local governments might reduce the dependence of regional center to activate the internal mechanisms of business community, local government, to achieve the fullest possible use of resources, combining the best interests of each region and state [182, p.145 ; 183, 184].

Effective functioning market environment, recreation and tourism should use market mechanisms, modern methods and means of administration. But this is only encourage management to a more appropriate action. Thus, one of the conditions that can ensure the successful functioning of the sector, is the formation of such organizational structure of management which will allow to take into account the needs and initiatives of all actors and stakeholders to develop regional, inter-regional and national socio-economic development, improve organizational and economic mechanisms of social growth and economic efficiency of recreation and tourism in the national economy.

To enhance the recreational, resort, tourist services to international standards should determine the priorities of perspective development of recreational and tourist areas that should be considered in the context of national and regional interests and ensure maximum state assistance for their

implementation [185, 186, 187]. Active government support in the context of globalization and the integration of Ukraine into the European Union, the legal guarantees of rights for foreign partners can create favorable conditions for attracting foreign investment. The resource base of Ukraine has a unique recreational and tourism potential, able to further develop the national tourism product and its output to international markets [39, p. 292-293].

So it is clear that the development of tourism and hospitality industry should provide that appropriate services to the general population, as well as protection of national interests of Ukraine. In order to effectively use the potential of the regions should pursue the national policy promoting the global market Ukraine as a state accessible and diverse tourism. Important areas of dissemination of positive image can be: revitalization of tourist information centers (TIC); wide advertising campaign promoting tourism opportunities of the country through tourism festivals and fairs; Ukraine's participation in major tourist events (fairs, exhibitions, tourist stores) to be presented; popularization of winter, summer and cultural activities, recreation for different age groups and specialized tourism;

Summarizing the above, it should outline the key areas of socialization of state regulation of recreation and tourism in Ukraine, namely:

improvement of the legal framework in accordance with international law; the use of regulatory and legal mechanisms to protect the interests of domestic companies to foreign markets; implementation of complex standards recreational and tourist products and related services (hotel, restaurant industry, transport, trade, etc.); widespread practice certification recreational and tourist services, licensing of institutions that provide them; optimization mechanisms to attract domestic and

foreign investors, small businesses and private initiative; new formation, maintenance and expansion of regional institutions interested in intensification of resort and recreational areas - economic associations, schools and business management, business support centers, agencies and foundations promoting local initiatives etc.

- strengthening of material and technological base and human capacities; improving network capacity and spa facilities in accordance with anthropogenic impact on the landscape and the needs of the population; implementation of environmental management mechanism; stimulate business activity in these economic activities; fundraising target undertakings to the implementation of programs of recreation and tourism; expansion of a network of leisure and recreation, restoration of historical and cultural monuments;

- development of the most promising types of recreation and tourism, which are year-round long and short-term vacation and spa treatment and rehabilitation, fitness, rock, including rock climbing, hang gliding, speleotourism, water and marine (including sailing), hunting, pedestrian, rural, equestrian tourism, tourism business and service, cultural, educational and other popular non-traditional and new forms of tourism (ecological, rural, green, etc.).

- achieving important goals of increasing coverage of health and recreation services; improvements in health and quality of life; accelerate human development in Ukraine as a whole and in all regions;

- improvement of advertising and information activities, promotion of recreational and tourist products in domestic and foreign markets; creating a network of tourist and resort information portals on the Internet; participation in international and national stores, fairs, festivals, conferences, symposia and forums; marketing research to study the demand

for tourist and recreational services domestic and foreign consumers.

Thus, the recreational and tourist sphere has a powerful social effect, which can be substantially strengthened by the relevant state policy. It should be aimed at forming such a market environment, organizational, economic and legal conditions that would contribute to the development of business in this area, free competition of producers of tourist and recreational services within established social and environmental objectives, territorial regulations. Recreational and tourist potential is an important component of the modern national economy of Ukraine. Today in the recreation and tourism sector of Ukraine there are 8.5 thousand enterprises, of which almost 3.9 thousand. - subjects of tourist activity (licensed travel agencies and tour operators), over 2.6 thousand hotels and similar accommodation facilities, about 2 thousand. sanatorium and health resorts. Features of geographic location and relief, favorable climate, richness of natural resource, historical and cultural and tourist and recreational potential.

CONCLUSIONS

The book is the theoretical generalization and author of solving important scientific task - to study theoretical and methodological principles of securing and strengthening the social purpose of recreation and tourism Ukraine.

On the basis of research formulated the following conclusions and practical recommendations.

- Proved that recreation and tourism is an important part of national economy, combining an extensive system of recreational facilities, infrastructure companies and other related industries, which have close economic and industrial ties, sharing resources to meet the diverse health, cognitive, cultural and other needs of the population. The primary purpose

and function of recreation and tourism defined restoring health and vitality of human development.

- It was found that the role of tourism and recreation in the social development of society is revealed through a wide range of social effects: the development of the human person; restore health; improving the social aspects of economic development (growth in employment, income, economy and GDP, etc.). Social effects (results) functioning investigated areas presented a systemic whole, a matrix in which systematized and its differentiated social results on the following criteria: industry (internal and external), timing (current, medium- and long-term), levels (local, regional and macro). Proved that using the matrix can be built not only to ongoing monitoring and planning and development of recreation and tourism through the establishment of socially important social goals.

- Argued that Ukraine has formed all the objective conditions to become one of the leading tourism and recreation of the world, but the analysis of the current state of functioning of the domestic sphere of recreation and tourism insufficient evidence of its effectiveness. discovered negative trends in its development: the discrepancy quality characteristics, organizational and economic mechanisms of recreation and tourism infrastructure with international norms and standards; significant loss of recreational potential as a result of military aggression; lack of information and advertising software in domestic and especially foreign markets; reduction and quality of life; deterioration of social orientation and effectiveness others.

- Based on comprehensive assessment of the social impact of the operation of recreation and tourism, made according to the proposed method, found a prevalence of inbound outbound tourism; deterioration in coverage and access to recreation and tourism: reduced the number of

domestic and inbound tourists; of specialized accommodation facilities (spa facilities) - during the years 2001-2014. from 3304 to 1928od. (41.6%), respectively 10 thousand. Population - from 0.7 to 0.4; quantity recovered in sanatoriums decreased from 3012 to 1610 thousand. people (46.5%) to 10 thousand. population - from 622 to 375 people. Found adverse trends in coverage of rehabilitation and recreation socially vulnerable groups, namely in 2016 functioned 9,7 thousand. Children's healthcare institutions (by 43.9% less than in 2010); reduced the number of recovered children of privileged categories of 490 thousand. to 244 thousand., including: children from large and poor families from 320.3 to 169.3 thousand .; children affected by the Chernobyl disaster - from 79.3 to 23.2; orphans and children without parental care - from 67.6 to 37.8;

- Positive growth trends, the number of such facilities as hotels and similar accommodation facilities for them, business tourism, the number of people served. However, given that these institutions provide services mostly for a fee, then take them to the positive characteristics of human development is possible only if the simultaneous growth of personal income. Revealed deterioration in employment in the field of recreation and tourism, namely the average number of full-time employees in health centers from 2001 to 2016 - by 57.9% (relative to 2013 - by 41.6%); employment rates - from 2005 by 15% (from 2013 - 29.6%). Instead, a growth in employment in the tourism activities 10632 (2005 g.) To 11,513 people (2016), which compared to 2013 less than 15%.

- Proved that empower people to travel and Ukraine should be healthier by increasing the level of income and economic stability due to the growth of GDP. An important area of social impacts of recreation and tourism defined small business development in this area, which is effective stabilization mechanism and means of implementing a particular business potential of the population. This increases

employment, promotes the growth of revenues, increased market flexibility and a greater focus on its social demands and needs of consumers. Emphasized that especially important in the context of strengthening the social dimension of recreation and tourism becomes rural tourism, for which Ukraine formed the necessary economic and institutional background.

- Argued the possibility of increasing the social and economic impact of the operation areas of recreation and tourism in Ukraine through: development and implementation of socially oriented state development strategies, improvement of state regulation in the direction of continuous monitoring of the achievement of socially important purposes activation mechanisms of state-private partnership, effective local government; state support for inbound, domestic and social tourism; improving the safety of tourism; support for small and medium businesses in the tourism sector; develop a mechanism to coordinate the activities of local executive authorities and business tourism business.

- Proved that empower people to travel and Ukraine should be healthier by increasing the level of income and economic stability due to the growth of GDP. An important area of social impacts of recreation and tourism defined small business development in this area, which is effective stabilization mechanism and means of implementing a particular business potential of the population. This increases employment, promotes the growth of revenues, increased market flexibility and a greater focus on its social demands and needs of consumers. Emphasized that especially important in the context of strengthening the social dimension of recreation and tourism becomes rural tourism, for which Ukraine formed the necessary economic and institutional background.

- Argued the possibility of increasing the social and economic impact of the operation areas of recreation and tourism in Ukraine through: development and implementation

of socially oriented state development strategies, improvement of state regulation in the direction of continuous monitoring of the achievement of socially important purposes activation mechanisms of state-private partnership, effective local government; state support for inbound, domestic and social tourism; improving the safety of tourism; support for small and medium businesses in the tourism sector; develop a mechanism to coordinate the activities of local executive authorities and business tourism business.

Grouping regions of Ukraine by a combined index of recreation and tourism, 2000-2016 years. (Without ARC and temporarily occupied territory DonetskLuhanskoyi regions) (Developed by the author)

And Annex

Development of indicators of sustainable development of tourist destinations and planning of tourism development *

Planning	Stages of	The role of
----------	-----------	-------------

	development indicators	indicators
A. Definition territory, its limits, priority functions	<p>Organizing indicator</p> <ul style="list-style-type: none"> • Determining the necessary data set for the development of indicators of sustainable development of territories based on their priority functions. 	Definition of the territory and its borders on the basis of natural, political and administrative boundaries
B. Identification of key stakeholders planning	<ul style="list-style-type: none"> • Attracting participants to develop indicators of sustainable development. 	Indicators - part of the planning process and catalyst for tourism development area
C. Formulating goals and priorities of the territories	<ul style="list-style-type: none"> • Identifying strengths and weaknesses of tourism in the area. • Development of long-term prognosis of the territory 	Development indicators - a key stage of the planning process, as the emerging view of the priority ways of development of the area and are the main parameters for assessing its potential
D. Preliminary assessment area (of its capacity), development of situation (SWOT) analysis to identify the strengths, weaknesses,	<p>development Indicators</p> <ul style="list-style-type: none"> • Defining priorities territory development and 	Indicators are needed to highlight the strengths and weaknesses of tourism in the

<p>threats and opportunities of tourism development</p>	<p>coordination in political circles.</p> <ul style="list-style-type: none"> • Preferred indicators. • Identifying sources of information. • The choice of indicators. <p>Indicators of implementation</p> <ul style="list-style-type: none"> • Assessment and informative reality indicators justify their accounting procedures. • Data collection and analysis 	<p>territory, identify potential risks and provide full information on them.</p> <p>Indicators inform participants about planning initial estimate potential territory</p>
<p>E. Determining short-, medium- and long-term plans (forecasts) territorial development based on the priority areas of</p>	<p>Designed and optimized indicators included in the planned development programs.</p>	<p>Indicators enhance the objectivity of evaluation are used to specify the purpose of improving the quality of work and its implementation. Especially important application of indicators to</p>

		compare the challenges of individual stages of temporary timing of its implementation, always interested managers and investors
F. The formulation and development of strategic objectives territory	Continuing data collection and analysis	Indicators can be used to determine the ratio analysis of strategic objectives and intermediate objectives
G. Formulation of work plans and special projects, which are based on the optimal development strategy	Political realities may significantly influence the choice of sources of information, its processing, which in turn, determines the use of indicators	Indicators can play a key role in designing and participate in the development of certain tasks and special projects
H. Implementation of work plans and special projects	11. Responsibility, reporting and interaction. Monitoring and impact assessment should be based on continuous observation of the interim report on the results. The basis is indicators. 12. The monitoring indicators used.	Monitoring indicators include: - management and management structure; - to achieve this goal; - changes in the environment and socio-cultural

	Research objectives, information sources used and assessment procedures may vary, so you should periodically review the indicators used	sphere
I. Monitoring and evaluation of development programs and projects		Indicators form public opinion on the evaluation results

Appendix L

SWOT-analysis of rural green tourism in Ukraine

Factor	Strengths (advantages)	Weaknesses (disadvantages)
1. Geography-position of the species	1. Convenient geographical position. 2. The large number of villages. 3. The unique landscapes	1. Distance from international routes
2. Population	1. homogeneous ethnic composition.	1. Complicated demographic

	<ol style="list-style-type: none"> 2. Local patriotism. 3. Certainty political preferences. 4. An active community. 5. More women than men. 6. Excess manpower. 7. The benefits for the population of mountain areas. 8. Hospitality population 	<p>situation (negative growth, low fertility, health).</p> <ol style="list-style-type: none"> 2. The high level of unemployment. 3. Labor immigration. 4. The relatively low standard of living. 5. The aging of the rural population. 6. Increase the number of dysfunctional families, families of incomplete
<p>3. Natural Resources</p>	<ol style="list-style-type: none"> 1. A large proportion of fertile soil and its environmental friendliness. 2. The presence of protected areas. 3. The high recreational potential. 4. Wealth springs. 5. Availability of raw materials construction industry. 6. Oil and gas. 7. Large reserves of 	<ol style="list-style-type: none"> 1. The depletion in certain areas of forest resources. 2. Insufficient investment in research of natural resources. 3. Inadequate use of recreational potential. 4. Inefficient use of nature-reserve fund. 5. erosion.

	<p>water resources.</p> <p>8. satisfactory water quality.</p> <p>9. The rich flora and fauna.</p> <p>10. Availability of raw materials for chemical industry, salt deposits</p>	<p>6. Lack of quality economic research potential of natural resources</p>
<p>4. Economy and industry</p>	<p>1. Availability of raw materials for wood and food industries.</p> <p>2. Oil and gas in villages.</p> <p>3. A significant proportion of private enterprises</p>	<p>1. Slight use of alternative energy.</p> <p>2. Low levels of energy-saving technologies.</p> <p>3. A significant intervention of foreign goods.</p> <p>4. Lack of strategic development programs of individual industries and enterprises.</p> <p>5. Lack of high-tech industries.</p> <p>6. Low level exposure to government and public management processes development of rural areas.</p>

		<p>7. A large number of national and regional programs that are not implemented.</p> <p>8. Low level of protection of domestic producers</p>
<p>5. Agriculture and processing of agricultural products</p>	<p>1. Multidisciplinary agricultural complex.</p> <p>2. The return of land ownership to farmers.</p> <p>3. Becoming farmers.</p> <p>4. Experience in managing collective farms.</p> <p>5. The presence of material base of the food industry</p>	<p>1. Low efficiency of agriculture.</p> <p>2. The working capital deficit.</p> <p>3. The sharp reduction in the number of collective farms operating.</p> <p>4. Insufficient introduction of intensive technologies.</p> <p>5. Ineffective use of farmland.</p> <p>6. No established system of agricultural residues production in farms.</p> <p>7. The decline of raw materials (reducing acreage crops, reducing the number of animals, etc.).</p> <p>8. Ineffective parity prices for agricultural products</p>

<p>6. Tourism, cultural, historical, recreational potential</p>	<ol style="list-style-type: none"> 1. Priority development areas. 2. Favorable economic and geographical location on the map of Europe. 3. International airports and a dense network of routes, connections. 4. Powerful recreational opportunities. 5. The rich historical and cultural heritage. 6. Unique tourist facilities, the so-called 'travel records. " 7. Ethnographic diversity preserved traditions, crafts and regional cuisine). 8. Favorable conditions for ski tourism. 9. bases for training athletes cycling infrastructure in 	<ol style="list-style-type: none"> 1. Insufficient use of recreational resources. 2. Lack of interaction between owners of small businesses and tourism estates. 3. Insufficient quality and range of travel services, lack of entertainment. 4. Lack of information on economic and fiscal management in the tourism business. 5. The staff at accommodation establishments do not speak foreign languages. 6. Underdeveloped network equipped tourist paths, shelters, viewing platforms, information stands at the tour sites. 7. underdeveloped eco-tourism at the natural reserve fund
---	---	--

	<p>mountainous areas.</p> <p>10. Network proznakovanyh paths for hiking.</p> <p>11. A strong educational base for training in tourism</p>	
7. Transport, engineering infrastructure	<p>1. Developed network communications.</p> <p>2. An extensive network of pipelines.</p> <p>3. Upgrade the vehicle fleet.</p> <p>4. Significant coverage area mobile phones of different operators.</p> <p>5. Experience in the use of narrow-gauge track</p>	<p>1. The unsatisfactory state routes, information services and so on.</p> <p>2. Small public investment in rural infrastructure.</p> <p>3. Lack of innovation in infrastructure projects</p>
8. Ecology	<p>1. A large proportion of environmentally friendly areas.</p> <p>2. A wide range of regional and international environmental programs</p>	<p>1. A small number of protected areas are protected.</p> <p>2. Large amount of waste and inefficient system of collecting.</p> <p>3. The territorial unevenness of anthropogenic impact.</p> <p>4. Much of eroded lands.</p>

		<p>5. Lack of information on the environmental condition in villages.</p> <p>6. Lack of environmental advocacy.</p> <p>7. Poor sanitary conditions of forestry</p>
9. Social sphere	<p>1. Historical and cultural heritage.</p> <p>2. The presence of original culture.</p> <p>3. High level of spirituality.</p> <p>4. The developed network of social and cultural facilities.</p> <p>5. A large number of masters of folk art.</p> <p>6. Participation talented youth in social and cultural events.</p> <p>7. Honoring national heroes.</p> <p>8. A slight widening of prostitution, alcoholism, AIDS</p>	<p>1. Weak material and technical base of cultural institutions.</p> <p>2. Lack of technical equipment of modern technology and equipment of medical institutions, educational institutions.</p> <p>3. negligent attitude toward spiritual traditions.</p> <p>4. Low Culture leisure.</p> <p>5. Low levels of consumer culture.</p> <p>6. Lack of money, lack of government funding education and health care</p>
10. Market infrastructure, entrepreneurship	1. Formation of the private sector desire to engage	1. Inadequate infrastructure for small business.

	private matter. 2. The presence of business centers. 3. Implementation of business development programs	2. Reluctance legalization of business activities. 3. Lack of a real credit and financial support to businesses in rural areas. 4. Inadequate cooperation in business, particularly in agriculture. 5. The complexity and uncertainty of tax legislation
--	---	---

Features	Threats (restriction)
1. Development of areas and solving actual problems of tourist sector through the implementation of tourism projects involving international technical assistance. 2. Implementation of investment projects aimed at developing tourism. 3. Deepening promotional and marketing activities in tourism. 4. Reduction of unemployment through alternative forms of employment and job towns. 5. Promoting Entrepreneurship. 6. Sustainable development of tourism and resorts. 7. The development and promotion of tour product; creating a favorable environment for tourism professionals support. 8. Development of ski	1. instability, changes in legal and regulatory framework. 2. The uncertainty of the transitional period, the general crisis. 3. Uncertainty, legal restrictions sustainable development. 4. Lack of entitlement to government. 5. The threat of administrative reform. 6. The threat of loss of independence due to economic expansion capital (foreign and other regions). 7. The level of corruption. 8. The worsening demographic situation. 9. The emergence of new centers of attraction of skilled labor.

<p>infrastructure, creation of new ski resorts.</p> <p>9. Organize recreational use areas, tourist routes, river banks, construction of tourist destinations, viewing platforms, installing signs to tourist sites.</p> <p>10. The development of recreational activities in the territories nature preserve.</p> <p>11. The development of tourism infrastructure in compliance with disability.</p> <p>12. Develop a network of tourist information centers.</p> <p>13. Increase investment in all areas of the village.</p> <p>14. Strengthening the innovation economy.</p> <p>15. The possibility of creating regional clusters (tourism, forestry).</p> <p>16. Formation of regional brands, including tourism.</p> <p>17. The new products and expanding the range.</p> <p>18. Increasing the depth of the forest.</p> <p>19. Development of crafts.</p> <p>20. Processing of forest products.</p> <p>21. The development of alternative energy sources.</p> <p>22. Creation of agricultural clusters (sugar, flax, milk and meat, etc.).</p> <p>23. The development of environmentally friendly products.</p> <p>24. The development of horticulture.</p> <p>25. Development of Fisheries.</p>	<p>10. Failure to understand the need for a competitive advantage.</p> <p>11. The presence of the shadow economy.</p> <p>12. Reducing the solvency of consumers and tourists.</p> <p>13. The financial and price instability and inflation.</p> <p>14. The deterioration of the investment climate.</p> <p>15. The privatization of regional resources non-regional companies.</p> <p>16. Limitation silhospresursiv, reducing agricultural productivity.</p> <p>17. Obstacles to market agricultural products.</p> <p>18. Competition tourism industry in other countries.</p> <p>19. Environmental risk, particularly from oil producing and chemical industries.</p> <p>20. Violation of ecological balance with excessive anthropogenic impact.</p>
